3.5	WYSIWYG Designer.....	24
3.5.1	Connect device or emulator .....	24
3.6	Tools.....	25
3.6.1	Generate Members .....	25
3.6.2	Change grid .....	26
3.7	Image files.....	27
3.8	Properties list.....	29
3.8.1	Main properties .....	30
3.8.2	Common properties.....	31
3.8.3	Activity / Main properties .....	32
3.8.3.1	B4A Activity properties .....	32
3.8.3.2	B4i Main properties.....	33
3.8.3.3	B4J Main properties .....	34
3.8.4	Color properties.....	35
3.9	Layout variants.....	37
3.10	Abstract Designer.....	41
3.10.1	Selection of a screen size .....	42
3.10.1.1	B4A Selection of a screen size.....	42
3.10.1.2	B4i Selection of a screen size.....	42
3.10.1.3	B4J Selection of a screen size .....	43
3.10.2	Zoom .....	44
3.10.3	Context menus.....	45
3.10.3.1	Add View .....	46
3.10.3.2	Cut.....	47
3.10.3.3	Copy .....	47
3.10.3.4	Paste .....	47

3.10.3.5	Duplicate .....	47
3.10.3.6	Undo / Redo .....	47
3.10.3.7	Horizontal Anchor.....	47
3.10.3.8	Vertical Anchor .....	48
3.10.3.9	Bring To Front .....	48
3.10.3.10	Send To Back .....	48
3.10.3.11	Generate .....	49
3.10.4	Select views.....	50
3.10.5	Example.....	52
3.11	Copy layouts cross platform between B4A, B4i and B4J .....	54
3.12	Adding views by code.....	55
3.12.1	B4A Adding views by code .....	55
3.12.2	B4i Adding views by code .....	58
3.12.3	B4J Adding views by code.....	62
3.13	Anchors .....	65
3.13.1	Horizontal Anchor.....	65
3.13.2	Vertical Anchor.....	66
3.13.3	AnchorChecker .....	68
3.13.4	Example project .....	71
3.13.5	Nested layouts .....	79
3.14	Designer Scripts .....	81
3.14.1	General .....	82
3.14.2	The menu.....	83
3.14.3	Supported Properties .....	84
3.14.4	Supported Methods .....	84
3.14.5	Supported Keywords.....	84
3.14.6	Autocomplete .....	85
3.14.7	Select a view in the DesignerScript with Ctrl + Click .....	86
3.14.8	Notes and tips.....	87
3.15	AutoScale .....	88
3.15.1	Simple AutoScale example with only one layout variant .....	89
3.15.2	Same AutoScale example with portrait and landscape layout variants.....	94
3.16	UI Cloud B4A and B4i.....	97
3.17	Designer Script Extension / DesignerUtils Class.....	99
3.17.1	Define a routine for the Designer.....	103
3.17.2	Make a b4xlib library .....	105
3.17.3	DesignerUtils methods B4X code.....	106
3.17.3.1	AddRuntimeView .....	106
3.17.3.2	GetAllLayoutParents.....	106
3.17.3.3	GetViewByName .....	106
3.17.3.4	GetViewData.....	106
3.17.3.5	GetViewsByClass .....	106
3.17.3.6	Initialize.....	107
3.17.3.7	RemoveLayoutData.....	107
3.17.4	DesignerUtils methods Script code.....	108
3.17.4.1	AddClass .....	108
3.17.4.2	CollectViewsData .....	108
3.17.4.3	Color.....	108
3.17.4.4	CreateToolbar.....	108
3.17.4.5	SetText .....	108

Be aware that external links don't work in the online display.

## 1 B4X platforms

B4X is a suite of programming languages for different platforms.

B4X suite supports more platforms than any other tool

ANDROID | IOS | WINDOWS | MAC | LINUX | ARDUINO | RASPBERRY PI | ESP8266 | AND MORE...

- **B4A**  **Android**

B4A is a **100% free** development tool for Android applications, it includes all the features needed to quickly develop any type of Android app.

- **B4i**  **iOS**

B4i is a development tool for native iOS applications.

B4i follows the same concepts as B4A, allowing you to reuse most of the code and build apps for both Android and iOS.

- **B4J**  **Java / Windows / Mac / Linux / Raspberry PI**

B4J is a **100% free** development tool for desktop, server and IoT solutions.

With B4J you can easily create desktop applications (UI), console programs (non-UI) and server solutions.

The compiled apps can run on Windows, Mac, Linux and ARM boards (such as Raspberry Pi).

- **B4R**  **ARDUINO** **Arduino / ESP8266**

B4R is a **100% free** development tool for native Arduino and ESP8266 programs.

B4R follows the same concepts of the other B4X tools, providing a simple and powerful development tool.

B4R, B4A, B4J and B4i together make the best development solution for the Internet of Things (IoT).

- **B4XPages**

B4XPages is an internal library for B4A, B4i and B4J allowing to develop easily cross-platform programs.

B4XPages is explained in detail in the B4XPages Cross-platform projects booklet.

Even, if you want to develop only in one platform it is interesting to use the B4XPages library it makes the program flow simpler especially for B4A.

## 2 Layouts

Designing layouts is a major concern for developers.

A well organized and nice-looking user interface makes a program being accepted immediately by the users or not, and this on different devices with different screen sizes.

Most users, when they look at a new application, decide in the first minutes if they will go further or not! Me too, when I download an application and there are several with the same purpose, the first impression is crucial. If I don't like the layout, I don't keep it.

You should have a look at:

- Androids' guidelines
- Apples' guidelines about how to design.

For the navigation between different pages, you should use the standard OS objects instead of reinventing the wheel. Users are used to them and feel directly 'at home'!

Android users are used to UI with Android look whereas Apple users may prefer the Apple look.

It's up to you to define what layout you want, what you want to display at the same time and how you want to navigate through the different displays.

In some cases, it might be better to have one or two layouts (portrait and / or landscape) phones and one or two layouts for tablets. Use as little layout variants as needed and use the different tools to adapt them to fit the different screen sizes.

As tablets have bigger screens than phones it could be interesting to display more information on tablets than on phones.

Depending on the application, it could be interesting to display one panel on pages in portrait on phones and display two panels side by side on a same page on tablets.

There are no general rules nor templates for user interfaces. They depend on the kind of application, the kind of information to display on what screen size, the number of different pages depending on the screen size and the information, etc.

Several tools are at your disposal to design the layouts, these are explained in the following chapters.

## 3 Visual Designer

The Visual Designer allows generating layouts with either the Abstract Designer or with a real device. You can also use Emulators but not recommended.

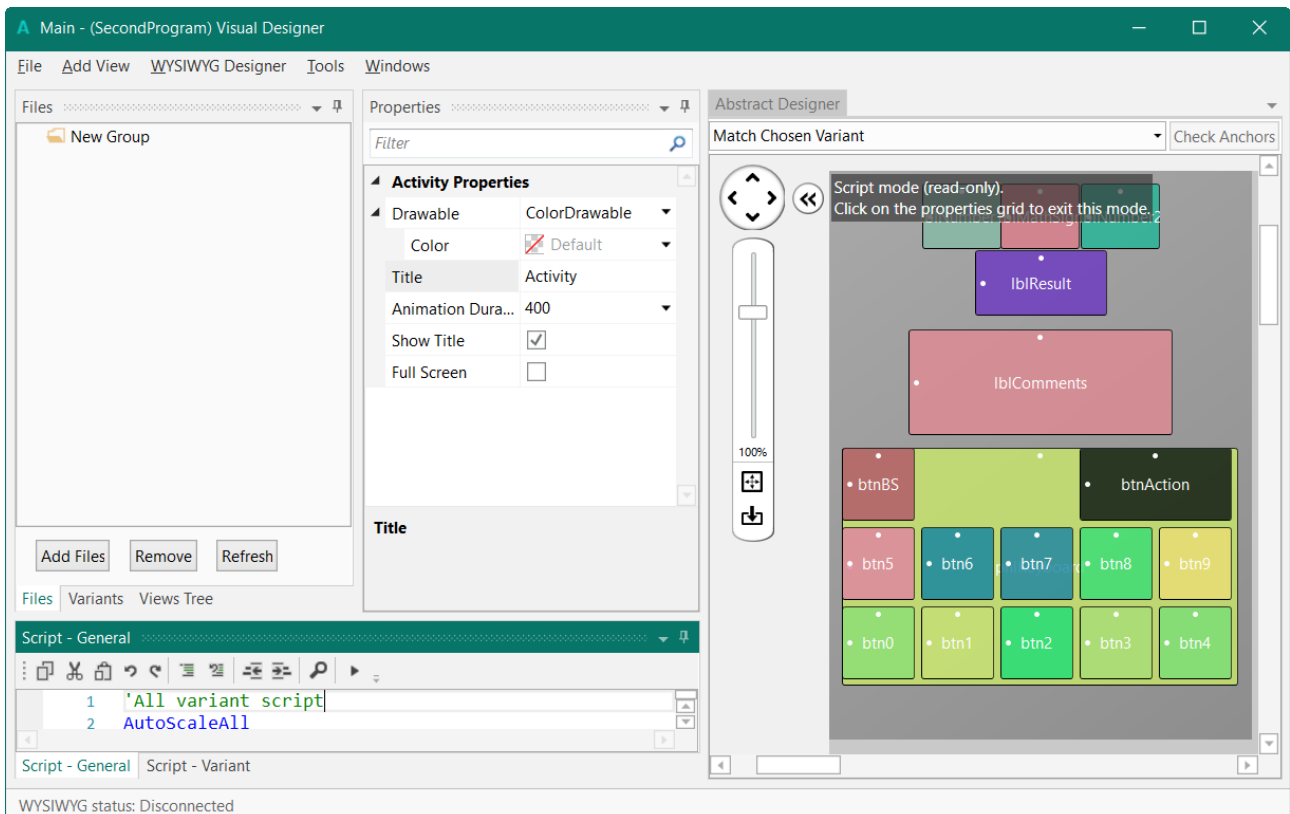

All the images in this booklet are made with the B4A Designer, but the others look similar with different themes.

Specific images for B4i or B4J are shown when needed.

Launch the Designer in the IDE Menu Designer.

The default Visual Designer looks like this, the layout in the Abstract Designer is from the SecondProgram project.

3.1 The menu

3.1.1 File menu

- New Opens a new empty layout.
- Open Opens an existing layout.
- Save Saves the current layout.
- Save As... Saves the current layout with a new name.
- Remove Layout Removes the layout from the Files directory.
- Close Window Closes the Visual Designer.
- Main Layout file list, in this case only one file, 'Main'.

3.2 AddView menu

3.2.1 B4A AddView menu

This menu allows you to add views to the current layout.

Add View	WYSIWYG Designer	
AutoCompleteEditText	AutoCompleteEditText	adds an AutoCompleteEditText
Button	Button	adds a Button
CheckBox	CheckBox	adds a CheckBox
CustomView	CustomView	adds a CustomView
EditText	EditText	adds an EditText
HorizontalScrollView	HorizontalScrollView	adds a HorizontalScrollView
ImageView	ImageView	adds an ImageView
Label	Label	adds a Label
ListView	ListView	adds a ListView
Panel	Panel	adds a Panel
ProgressBar	ProgressBar	adds a ProgressBar
RadioButton	RadioButton	adds a RadioButton
ScrollView	ScrollView	adds a Scrollview
SeekBar	SeekBar	adds a SeekBar
Spinner	Spinner	adds a Spinner
TabHost	TabHost	adds a TabHost
ToggleButton	ToggleButton	adds a ToggleButton
WebView	WebView	adds a WebView

### 3.2.2 B4i AddView menu

This menu allows you to select the view you want to add to the current layout.

Add View	Tools	Windows
ActivityIndicator	ActivityIndicator	adds an ActivityIndicator
Button	Button	adds a Button
CustomView	CustomView	adds a CustomView if there are any.
DatePicker	ImageView	adds an ImageView
ImageView	Label	adds a Label
Label	Panel	adds a Panel
Panel	Picker	adds a Picker
Picker	ProgressView	adds a ProgressView
ProgressView	ScrollView	adds a ScrollView
ScrollView	SegmentedControl	adds a SegmentedControl
SegmentedControl	Slider	adds a Slider
Slider	Stepper	adds a Stepper
Stepper	Switch	adds a Switch
Switch	TextField	adds a TextField
TextField	TextView	adds a TextView
TextView	WebView	adds a WebView
WebView		

### 3.2.3 B4J AddView menu

This menu allows you to select the view you want to add to the current layout.

Add View	WYSIWYG Design	
Accordion	Accordion	adds an Accordion
Button	Button	adds a Button
Canvas	Canvas	adds a Canvas
CheckBox	CheckBox	adds a CheckBox
ChoiceBox	ChoiceBox	adds a ChoiceBox
ColorPicker	ColorPicker	adds a ColorPicker
ComboBox	ComboBox	adds a ComboBox
CustomView	CustomView	adds a CustomView if there are any.
DatePicker	DatePicker	adds a DatePicker
HTMLEditor	HTMLEditor	adds an HTMLEditor
ImageView	ImageView	adds an ImageView
Label	Label	adds a Label
ListView	ListView	adds a ListView
MenuBar	MenuBar	adds a MenuBar
Pagination	Pagination	adds a Pagination
Pane	Pane	adds a Pane
ProgressBar	ProgressBar	adds a ProgressBar
ProgressIndicator	ProgressIndicator	adds a ProgressIndicator
RadioButton	RadioButton	adds a RadioButton
ScrollPane	ScrollPane	adds a ScrollPane
Slider	Slider	adds a Slider
Spinner	Spinner	adds a Spinner
SplitPane	SplitPane	adds a SplitPane
TableView	TableView	adds a TableView
TabPane	TabPane	adds a TabPane
TextArea	TextArea	adds a TextArea
TextField	TextField	adds a TextField
ToggleButton	ToggleButton	adds a ToggleButton
TreeTableView	TreeTableView	adds a TreeTableView
TreeView	TreeView	adds a TreeView
WebView	WebView	adds a WebView

### 3.2.4 WYSIWYG Designer menu B4A, B4J

Connects a device or an Emulator to the Visual Designer.  
Disconnect from Device / Emulator.

For details on how to connect a real device look at chapter *B4A connecting a real device* in the Getting started B4X Booklet. In B4J it connects to a Form.

The connected device with its parameters is displayed in the lower left corner.

### 3.2.5 The Tools menu

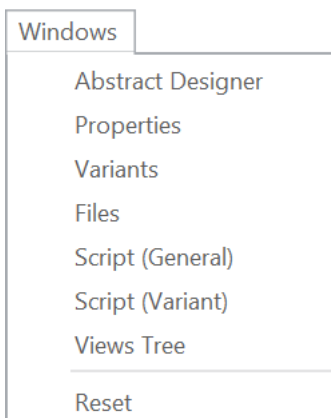

[Generate Members](#) Members generator

[Change Grid](#) Allows to change the grid size

Send To [UI Cloud](#). B4A and B4i only.

### 3.2.6 Windows menu

Shows the [Abstract Designer](#) window.

Shows the Properties window.

Shows the Variants window.

Shows the Files window.

Shows the Script (General) window.

Shows the Script (Variant) window.

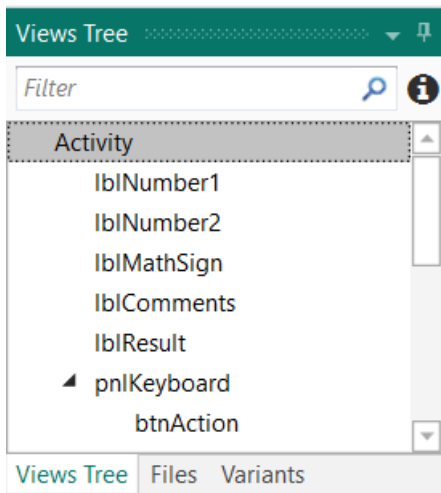

Shows the Views window.

Resets the Visual Designer layout to the default layout.

### 3.3 Visual Designer Windows

The Visual Designer is composed of different windows.

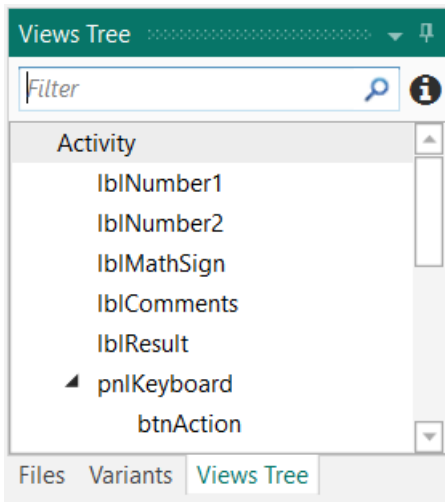

#### 3.3.1 Views windows Views Tree / Files / Variants

In this Window three windows are grouped together:

- Files
- Variants
- Views Tree.

### 3.3.1.1 Views Tree window

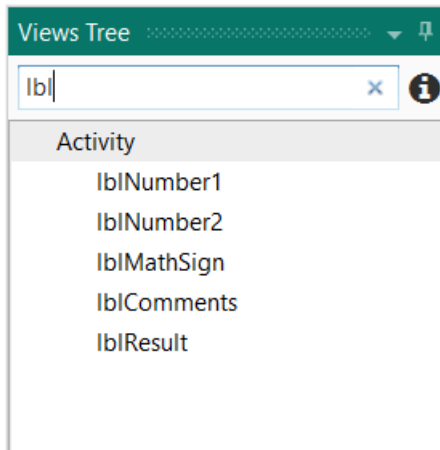

Shows all views of the selected layout in a tree.

When you select a view in the list, all the properties of the selected view are displayed in the Properties window.

You can select several Views at the same time and change common properties.

The selected views are highlighted in the Abstract Designer.

On top you can filter the views / nodes.

Enter 'lbl' and all the views containing lbl will be displayed in the list.

 shows tips:

 Filter  
Tip: Ctrl + Click to select multiple items.  
F2 to rename item.

### 3.3.1.2 Files Windows

Used to add or remove files to the Visual Designer, mainly image files.

File handling is explained in the [Image Files](#) chapter.

These files are copied to the Files folder of the project and can be accessed in the code in the File.DirAssets folder.

### 3.3.1.3 Variants window

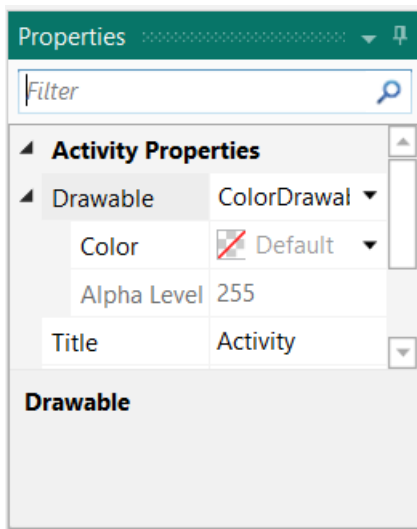

Used to add and remove layout variants.

Layout variants are explained in the [Layout variants](#) chapter.

### 3.3.2 Properties window

The Properties window shows all properties of the selected View.

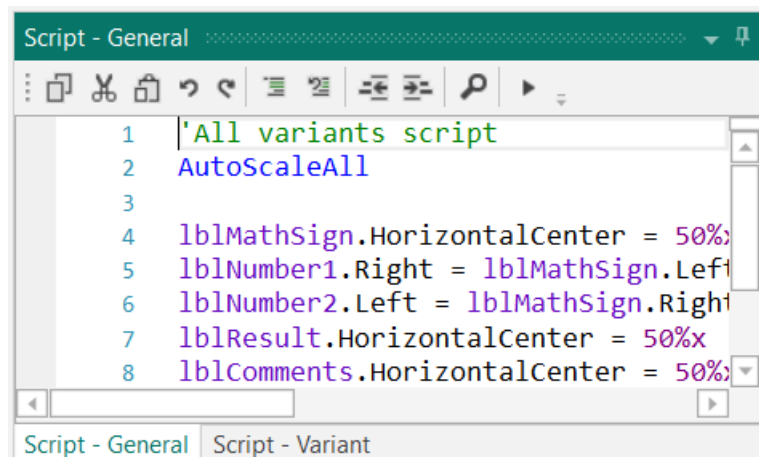

The Properties are explained in the [Properties list](#) chapter.

### 3.3.3 Script (General) / (Variant) windows

In the Scrip windows you can add code to position and resize Views.

Two windows are available:

- **Script - General** Code valid for all layout variants.
- **Script - Variant** Specific code for the selected layout variant.

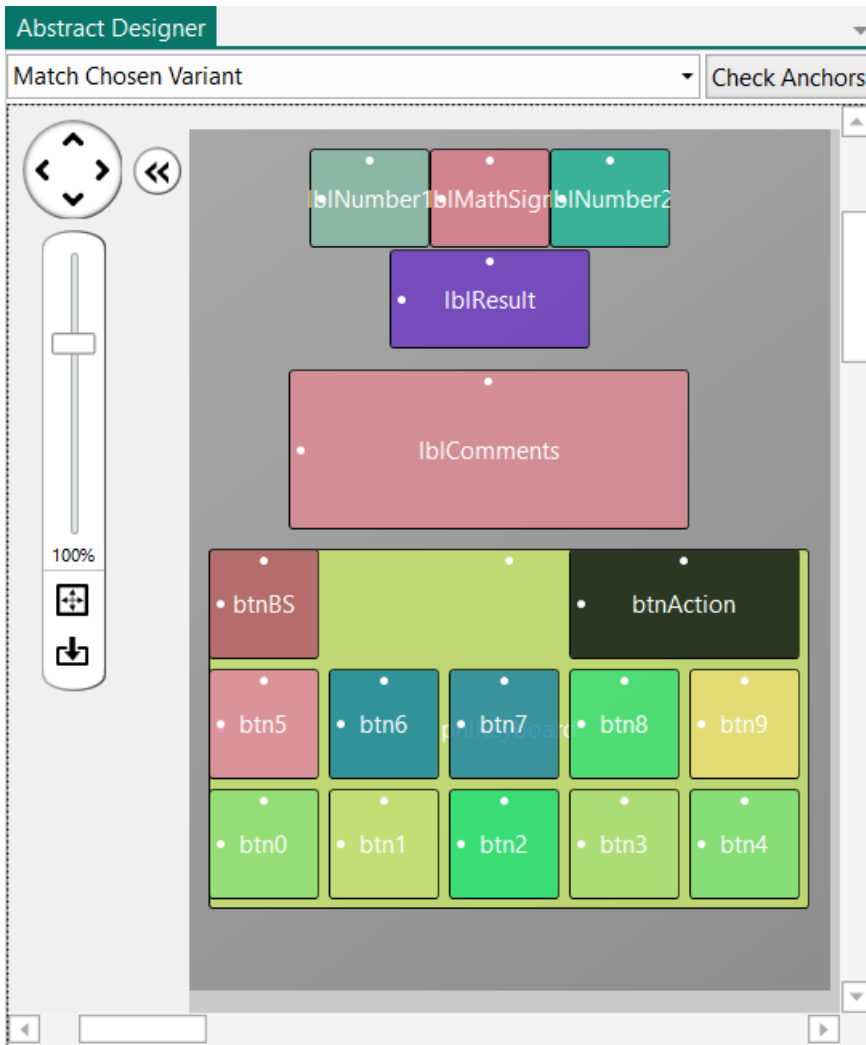

Script code is explained in the [Designer Scripts](#) chapter.

### 3.3.4 Abstract Designer window

The Abstract Designer allows to select, position and resize Views.

It is not a WYSIWYG Designer, for this you need to connect a real device or an Emulator.

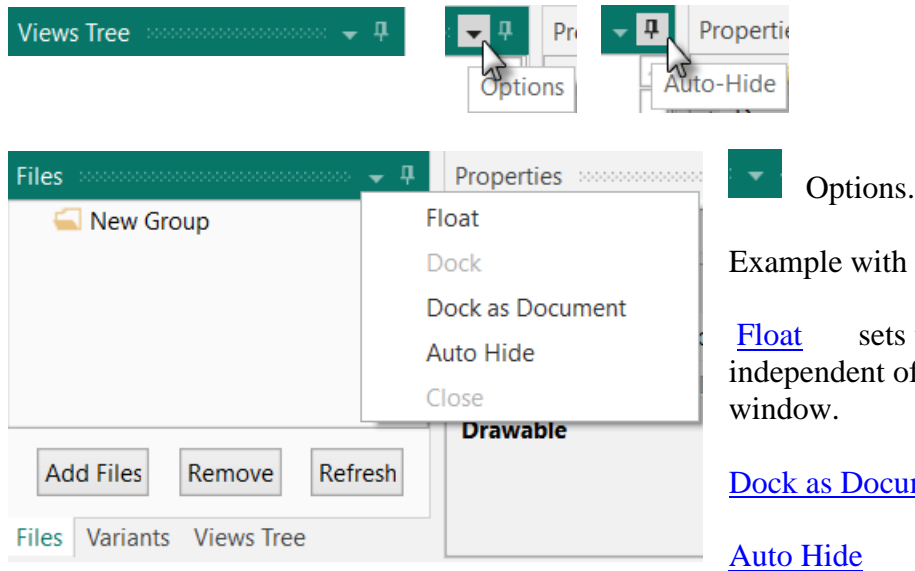

The displayed layout in the picture below is from the SecondProgram project.

## 3.4 Floating windows

You can define your own Visual Designer layout, rearrange the windows in size and position, docked or floating.

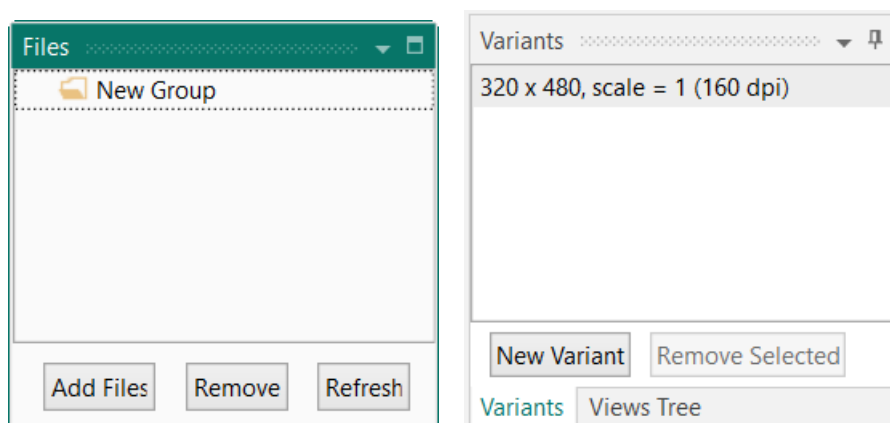

On top of each window two icons allow you to manage the behaviour of this window.

### 3.4.1 Float

The Files windows is independent from the Visual Designer and is removed from the Views window.

### 3.4.2 Dock

Click on

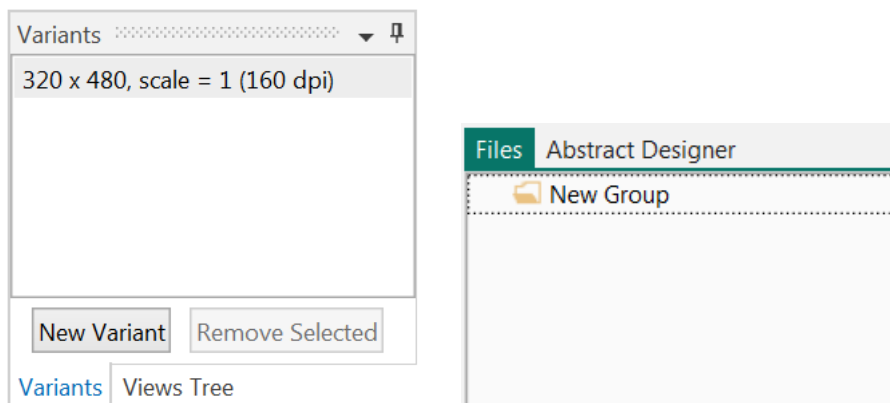

The window is moved back to the Views window.

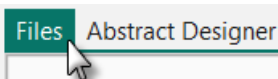

### 3.4.3 Dock as Document

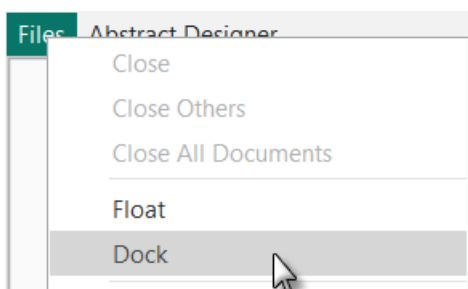

Click on

The window is removed from its parent window and added to the Abstract Designer window.

Right click on  and on  to move it back to its parent window.

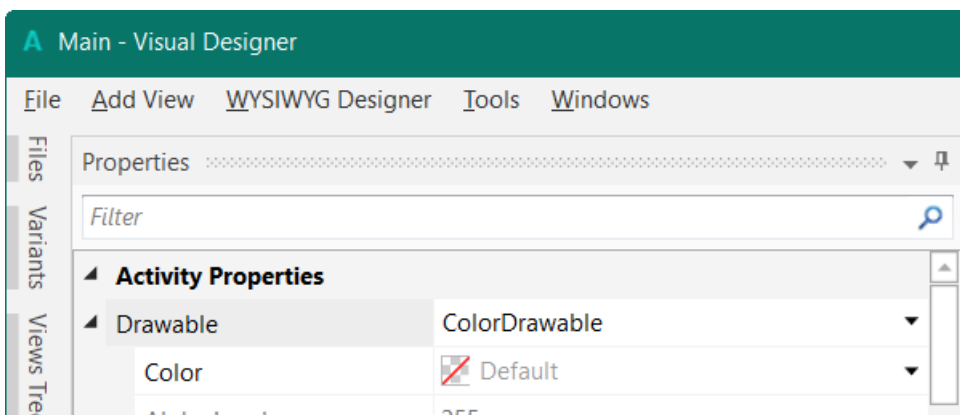

### 3.4.4 Auto Hide

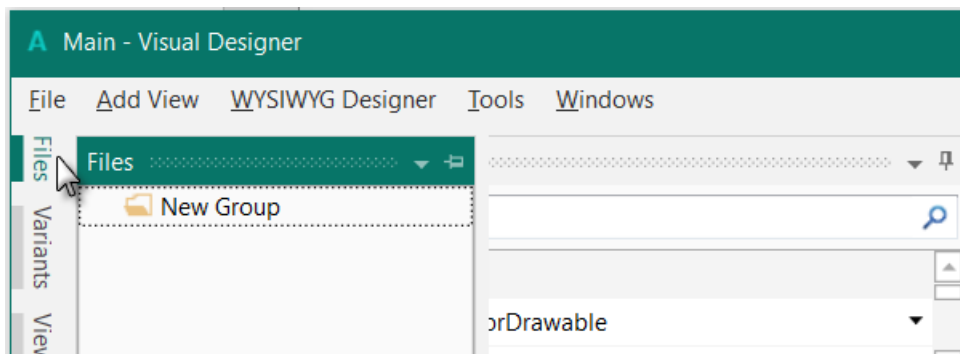

Click either on  or on **Auto Hide**.

The three windows Files, Variants and Views Tree are moved as Tabs to the left border of the Visual Designer. The Properties window width is increased.

Click on a Tab to show the window.

When you click somewhere else, outside the selected window, hides it automatically.

Click on  in the title to move the windows back to their previous position.

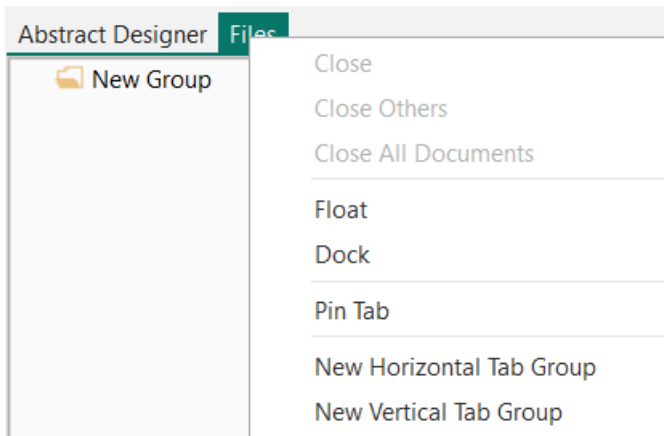

### 3.4.5 Maximize

Floating windows can be maximized.

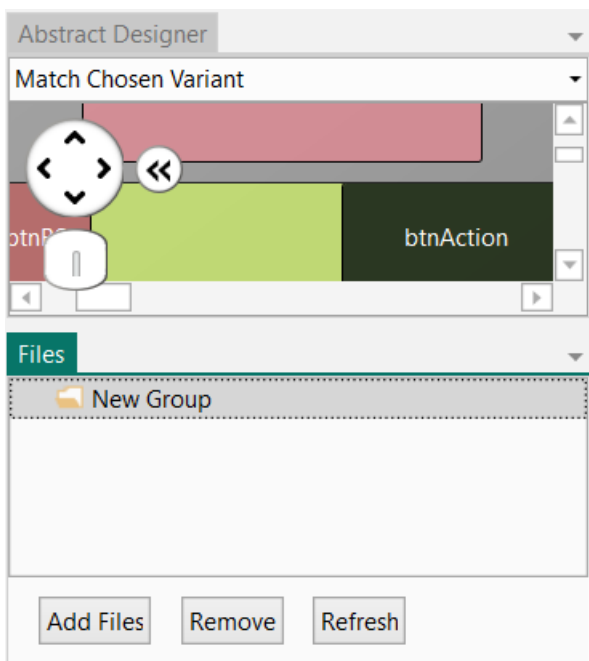

### 3.4.6 New Horizontal / Vertical Tab Group

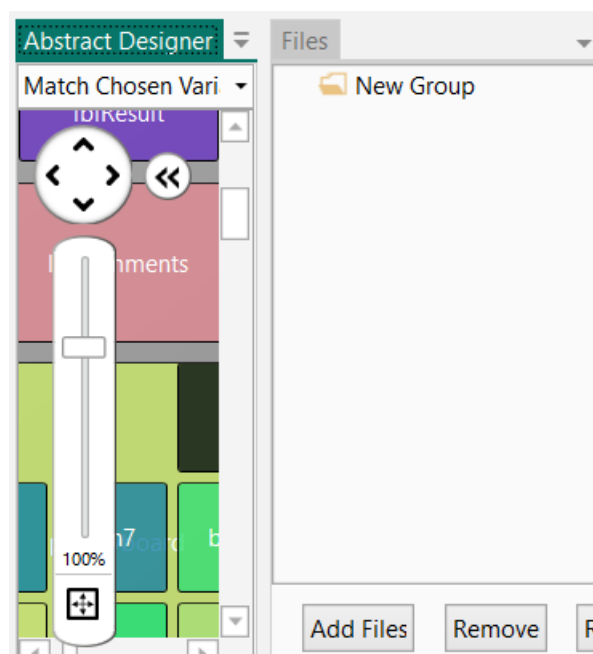

When a window is set as *Dock as Document* two other options are available.

New Horizontal Tab Group  
New Vertical Tab Group

New Horizontal Tab Group

New Vertical Tab Group

To remove Tab Group right click on **Files** and click on **Move to Previous Tab Group**.

## 3.5 WYSIWYG Designer

### 3.5.1 Connect device or emulator

To connect a device or an emulator click **Connect** in the WYSIWYG Designer menu or press F2.

If different devices or Emulators are connected, you will be asked which device or Emulator you want to connect to.

Select an emulator or a device in the list.

Click on **Select** to confirm.

To disconnect it click on **Disconnect** in the WYSIWYG Designer menu or press **SHIFT + F2**.

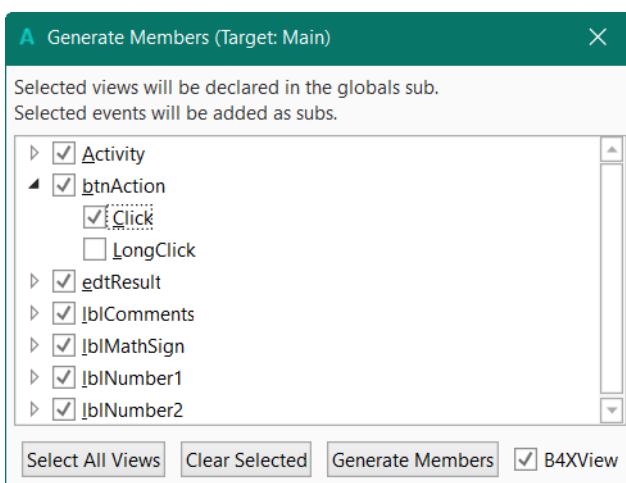

## 3.6 Tools

### 3.6.1 Generate Members

Generates declaration statements and subroutines frames. A similar function exists in the [Abstract Designer context menu](#). The example is based on the MyFirstProgram project.

Click on **Generate Members** to open the generator.

Here we find all the views added to the current layout (MyFirstProgram).

We check all views and check the Click event for the btnAction Button.

Checking a view ☒ edtResult generates its reference in the Globals Sub routine in the code. This is needed to make the view recognized by the system and allow the autocomplete function.

Views can be declared either as product original views or as B4XViews.

For that check: ☒ B4XView .

**Note: The code is added in the active module.**  
The destination module is displayed in the title

**Generate Members (Target: Main)**

bar.

Variable declarations in Globals

☐ B4XView

**Sub Globals**

```
Private btnAction As Button
Private edtResult As EditText
Private lblComments As Label
Private lblMathSign As Label
Private lblNumber1 As Label
Private lblNumber2 As Label
```

☒ B4XView

**Sub Globals**

```
Private btnAction As B4XView
Private edtResult As B4XView
Private lblComments As B4XView
Private lblMathSign As B4XView
Private lblNumber1 As B4XView
Private lblNumber2 As B4XView
```

Clicking on an event of a view ☒ Click generates the Sub frame for this event.

**Sub btnAction\_Click**

**End Sub**

Click on **Generate Members** to generate the references and Sub frames.

Click on **Select All Views** to select all vies in the list,

Click on **Clear Selected** to clear the current selections.

### 3.6.2 Change grid

The grid is an invisible grid with a given size. The default grid size is 10 pixels. That means that all positions and dimensions of a view will be set to values in steps corresponding to the grid size. Moving a view will be done in steps equal to the grid size.

In the **Tools** menu click on **Change Grid**.

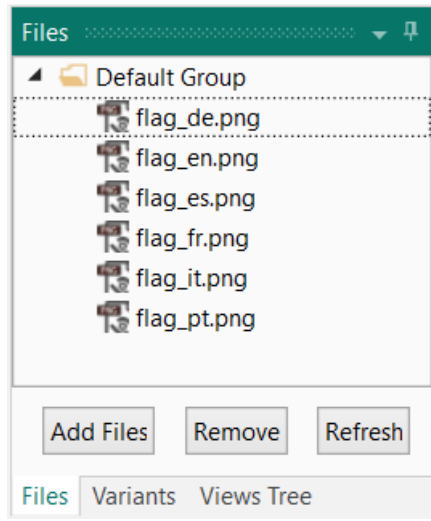

You can change the grid size to the value you want.

The value is saved in the layout file, you will get the same value when you reload this layout.

The default value when you start a new project is 10.

## 3.7 Image files

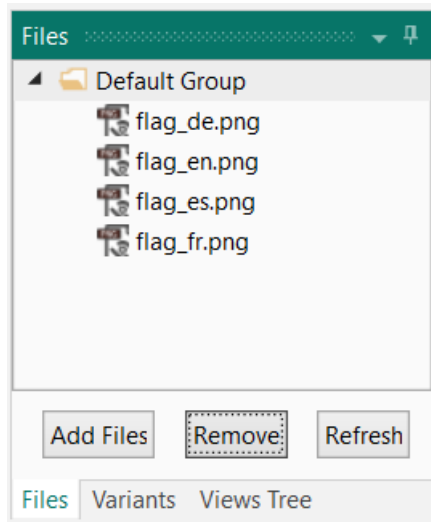

You can add image files to the layout.

Click on **Add Files** to select the file(s) to add.

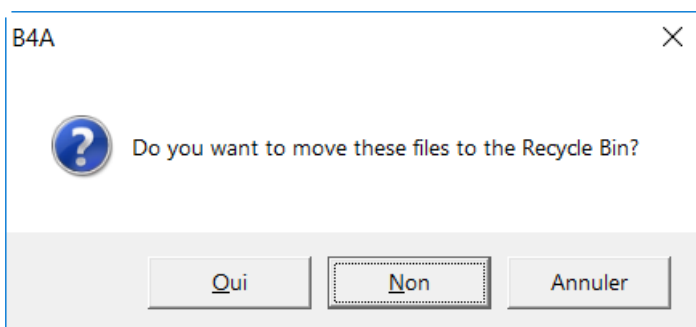

These files will be listed in the Image Files list.

These files are saved to the Files folder of the project and can be accessed in the code in the Files.DirAssets folder.

To remove files, check the files to remove and click on **Remove**.

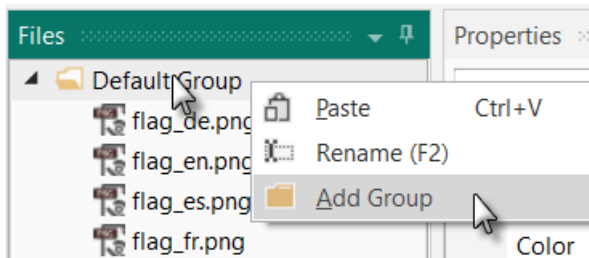

You are asked if you want to move these files to the Recycle Bin.

You can define different groups for the files.

Add a new group.

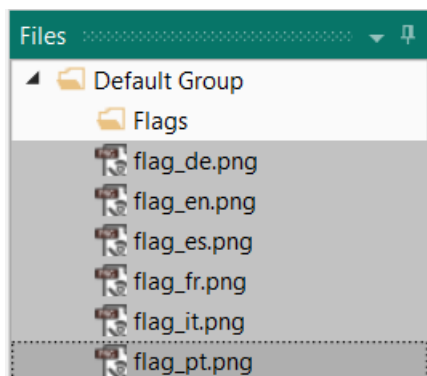

Right click on  Default Group and click on .

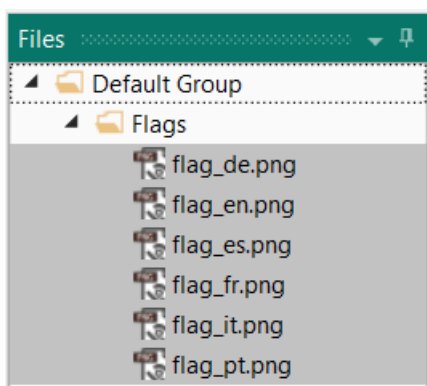

Enter the name.

For example 'Flags'

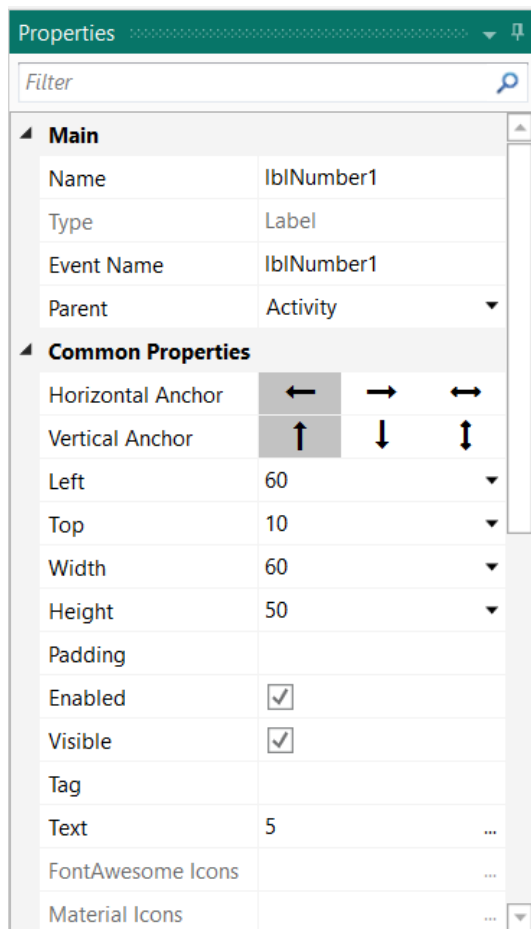

Select the 'flag' files and move them into the Flags group.

The flag files are now in the Flags group.

Different files can be grouped in different groups, but they remain in the Files folder of the project.

## 3.8 Properties list

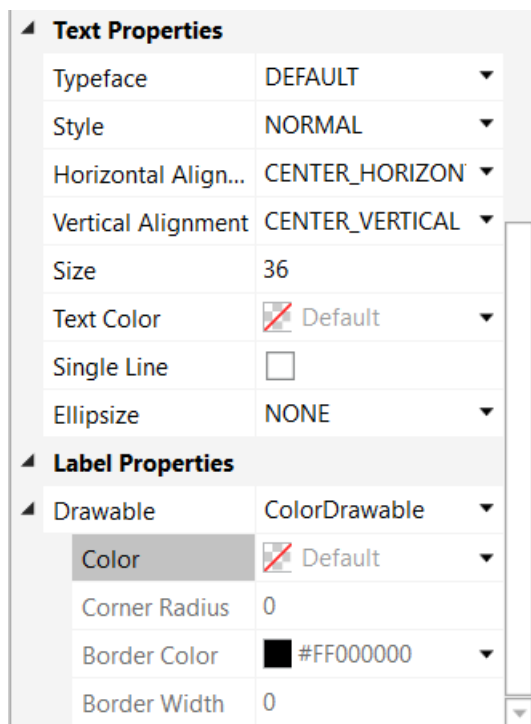

Select for example lblNumber1 in the list.

All the properties of lblNumber1 are displayed. These are organized in groups.

All properties can be modified directly in the list.

All properties in the Main group and some of the properties in the other groups are common to all view types.

### 3.8.1 Main properties

**Name** Name of the view (B4A, B4i) or node (B4J). It is good practice to give meaningful names. Common usage is to give a 3-character prefix and add the purpose of the view. In the example, the view is of type Label and its purpose is to enter a result. So, we give it the name "lblResult", "lbl" for Label and "Result" for the purpose. This does not take much time during the design of the layout but saves a lot of time during coding and maintenance of the program.

**Type** Type of the view (B4A, B4i) or node (B4J), not editable. It is not possible to change the type of a view. If you need to, you must remove the view and add a new one.

**Event Name** Generic name for the subroutines that manages the view's events. By default, the Event Name is the same as the view's name like in the example. The Events of several views can be redirected to a same subroutine. In that case you must enter the name of that routine. Look at the SecondProgram example for the Click event management for the buttons of the keyboard, the *btnEvent\_Click* routine.

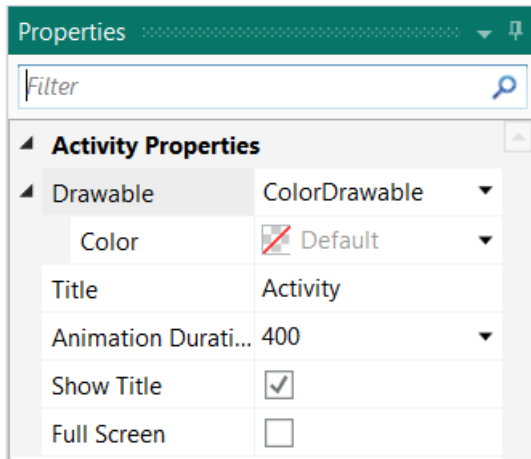

**Parent** Name of the parent view (B4A, B4i) or node (B4J). Activity, in the example. The parent view can be changed in selecting the new one in the list.

### 3.8.2 Common properties

<b>HorizontalAnchor</b>	Horizontal <a href="#">Anchor</a> function. Possible values LEFT, RIGHT or BOTH 
<b>VerticalAnchor</b>	Vertical <a href="#">Anchor</a> function. Possible values TOP, BOTTOM or BOTH 
<b>Left</b>	X coordinate of the left edge of the View from the left edge of its parent View, in pixels (the pixels are in reality dips, density independent pixels).
<b>Top</b>	Y coordinate of the upper edge of the View from the upper edge of its parent View, in pixels (the pixels are in reality dips, density independent pixels).
<b>Width</b>	Width of the View in pixels (the pixels are in reality dips, density independent pixels).
<b>Height</b>	Height of the View in pixels (the pixels are in reality dips, density independent pixels).
<b>Enabled</b>	Enables or disables the use of the View Ex: Enabled = True <b>B4A, B4J</b>
<b>Visible</b>	Determines if the View is visible to the user or not.
<b>Tag</b>	This is a place holder which can used to store additional data. Tag can simply be text but can also be any other kind of object. Tag is used in the SecondProgram example for the numeric buttons click events management in the btnEvent_Click routine.
<b>Text</b>	The text which will be displayed in the View, this property is only available for views having a Text property.

### 3.8.3 Activity / Main properties

#### 3.8.3.1 B4A Activity properties

**Drawable** Sets the Activity background Drawable, the default property is ColorDrawable.

**Title** Sets the activity title text.

**Animation Duration** Sets the animation duration in milliseconds.  
When you launch the program, the Activity is not shown directly but grows with the given duration. If you set this value to '0' the Activity will be shown instantly.

**Show Title** Changes the Abstract Designer height.  
This setting does not change the Activity property, only the Abstract Designer height.

**Full Screen** Changes the Abstract Designer height.  
This setting does not change the Activity property, only the Abstract Designer height.

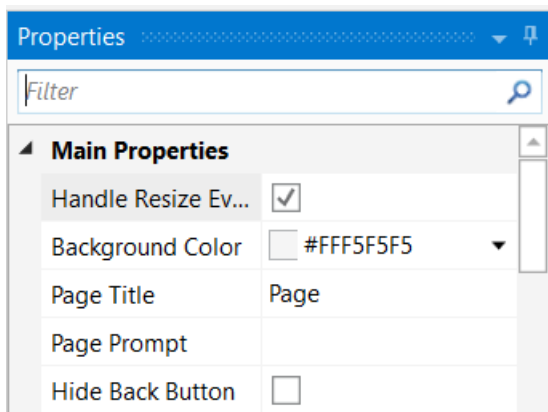

To not show the titles or set full screen, you need to set these two properties in the Module code in the `Activity Attributes` or `Module Attributes Regions`:

```
#Region Activity Attributes
  #FullScreen: False
  #IncludeTitle: True
#End Region
```

Checking or unchecking the last two properties only changes the visible screen size in the Abstract Designer.

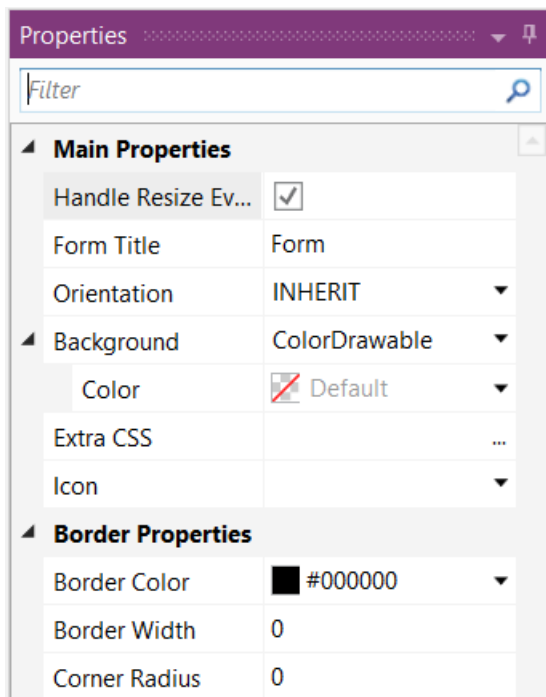

### 3.8.3.2 B4i Main properties

<b>Handle Resize Event</b>	Handles the resize event.
<b>Background Color</b>	Sets the Title text of the Page.
<b>Page Title</b>	Sets the Title text of the Page.
<b>Page Prompt</b>	Sets the Prompt text of the Page.
<b>Hide Back Button</b>	Shows or hides the Back button.

### 3.8.3.3 B4J Main properties

<b>Handle Resize Event</b>	Handles the resize event.
<b>Form Title</b>	Sets the Title text of the Form.
<b>Orientation</b>	Sets the Form orientation.
<b>Background</b>	Sets Form Activity background Drawable, the default property is ColorDrawable.
<b>Extra CSS</b>	Extra layout properties defined with CSS strings.
<b>Icon</b>	Icon selector.
<b>Border Properties</b>	Sets the border properties of the RootPane.
<b>Border Color</b>	Sets the border color, default Black.
<b>Border Width</b>	Sets the border width, default 0.
<b>Border Radius</b>	Sets the border radius, default 0.

Default

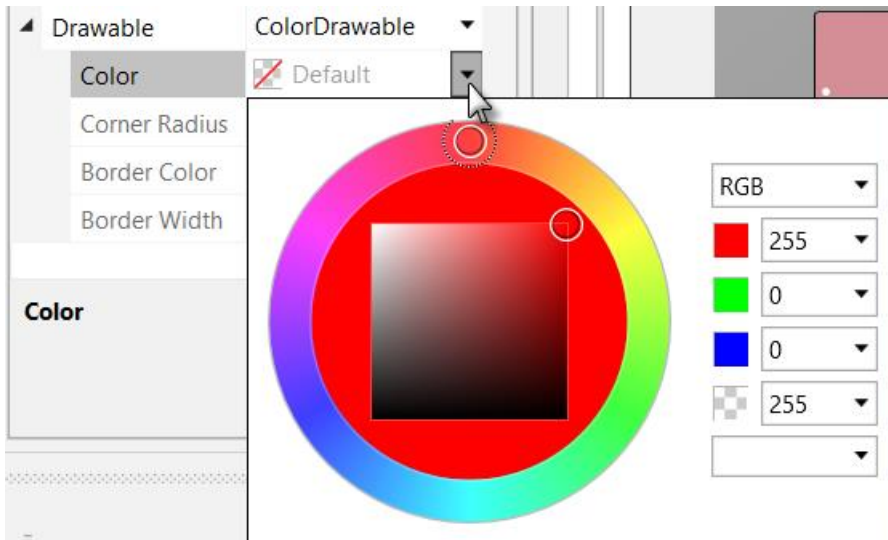

Color: Black, Width: 5, Radius: 10

### 3.8.4 Color properties

For some properties, like ColorDrawable color, TextColor, you can select a color.

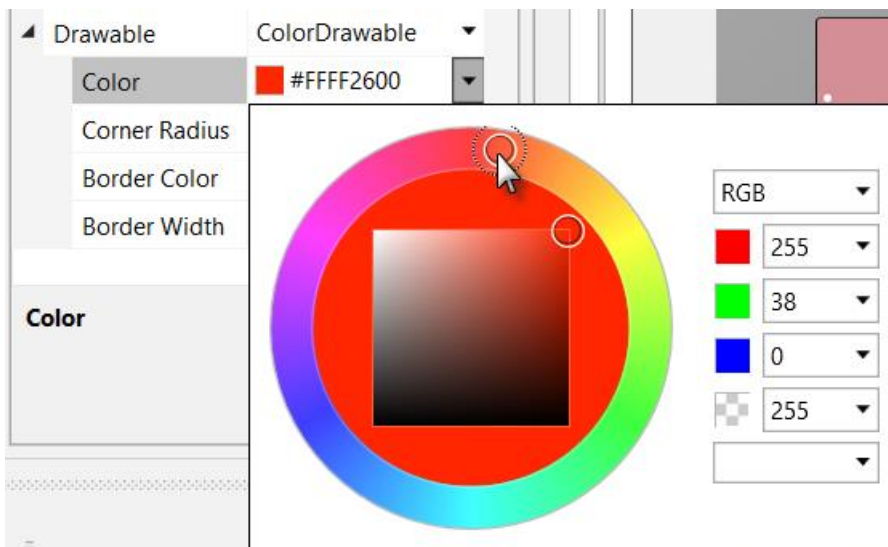

By default, the Default color is selected.

Click on  to select another color.

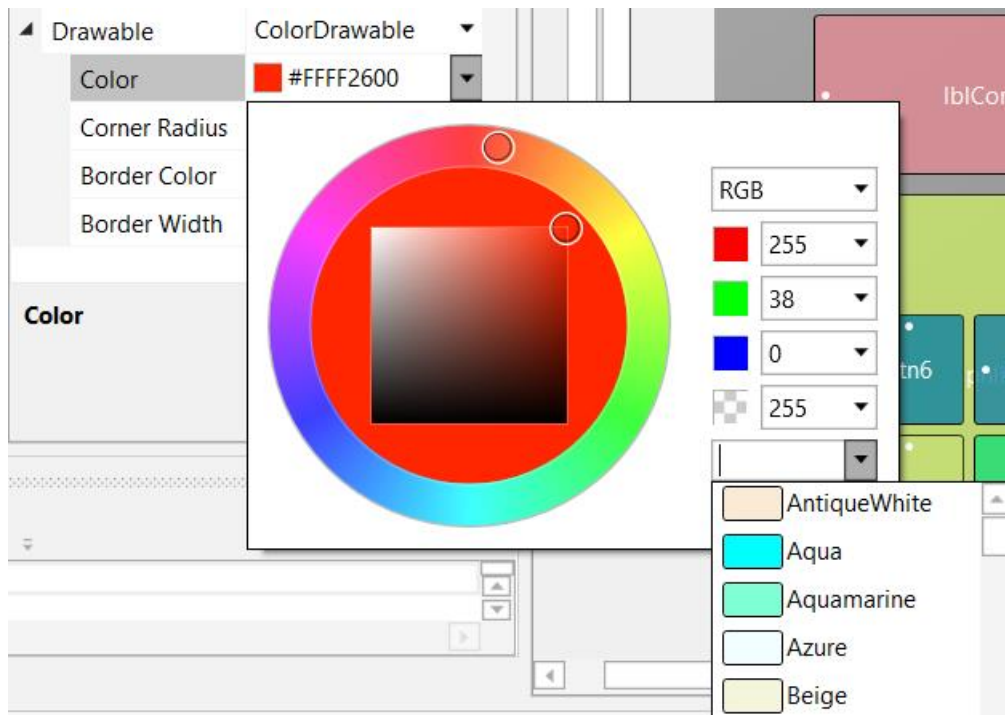

The color picker is displayed.

You can either:

- Move the cursor in the outer circle to select a color.
- Move the cursor in the square to select the 'darkness'.
- Enter RGB or HSB values.
- Select a predefined color.

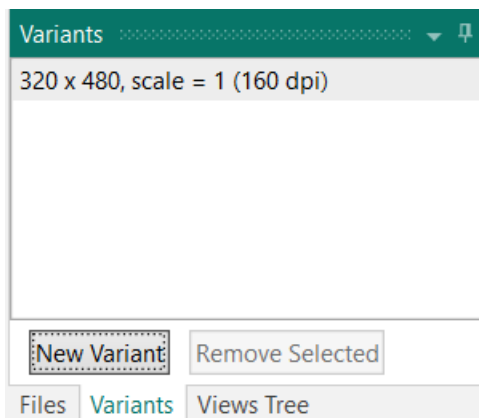

Select a predefined color.

To reset the default color remove the hex color code.

## 3.9 Layout variants

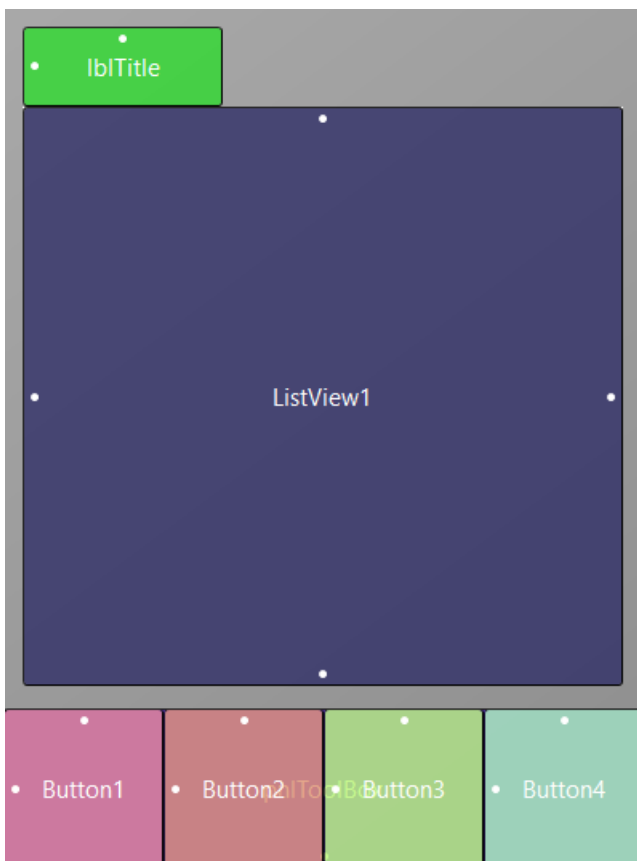

Different layout variants can be managed in a same layout file.

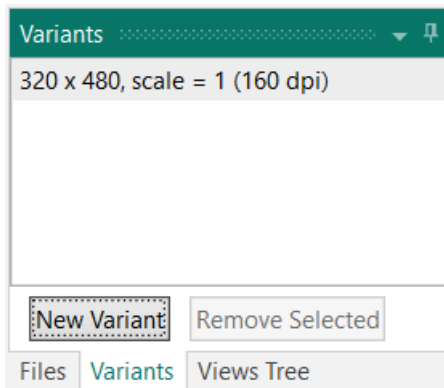

Let us make an example based on the TestLayoutsAnchors project

(which can be found under the GettingStarted\SourceCode\TestLayoutsAnchors directory):

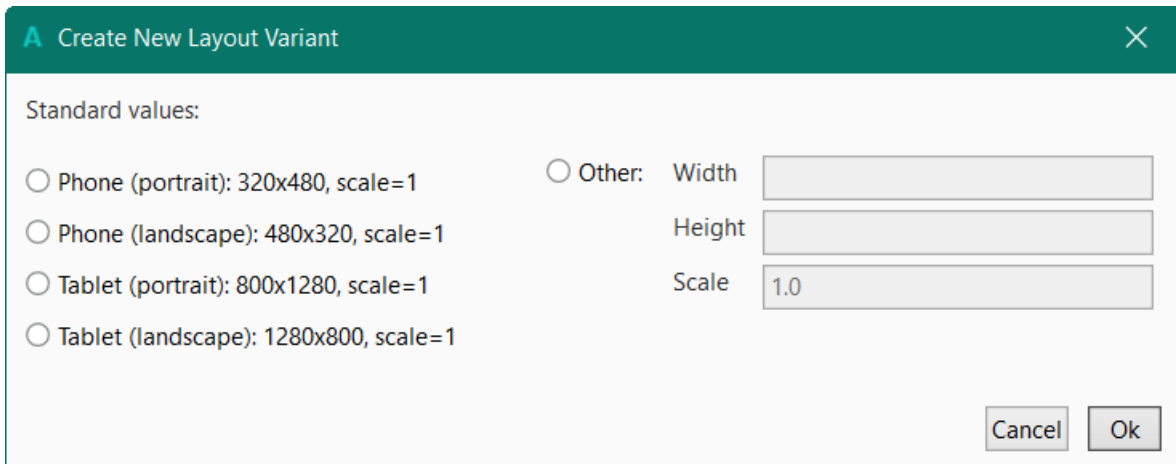

- Create a new folder and name it TestLayoutVariants.
- Copy the whole contents of the TestLayoutsAnchors folder.
- Rename the TestLayoutAnchors.b4a file to TestLayoutVariants.b4a.
- Rename the TestLayoutAnchors.b4a.meta file to TestLayoutVariants.b4a.meta.
- Run the IDE.
- Run the Visual Designer.

The layout in the Abstract Designer should look like this.

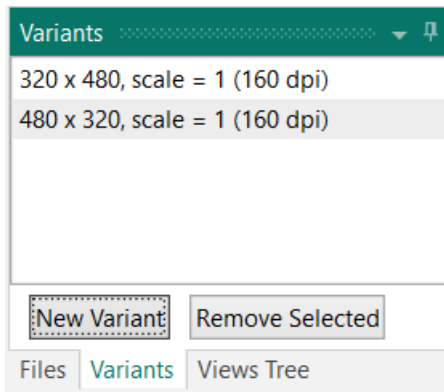

In the Designer, click on **New Variant**.

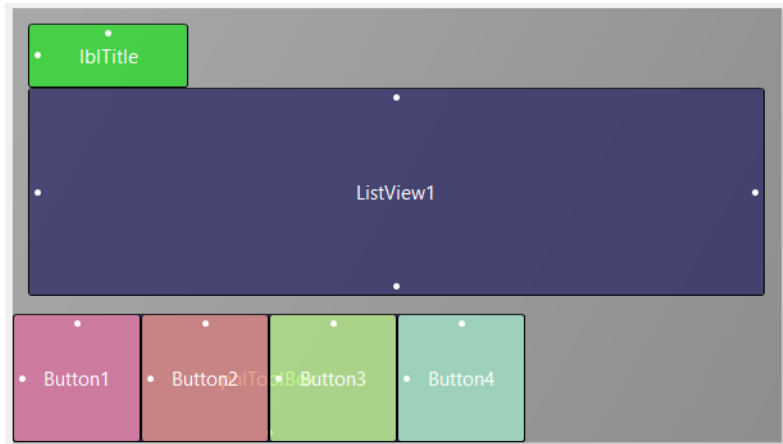

Select: Phone (landscape):480 x 320, scale = 1

Click on **Ok**.

The new variant is added.

In the Abstract Designer you'll see something like this.

We see that the anchors work well.

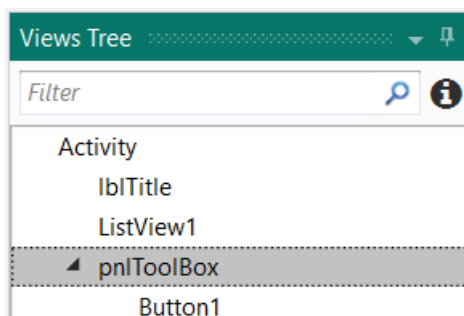

pnlToolBox is still at the bottom of the screen and ListView1 is stretched the fill almost the whole screen width.

But for the landscape variant we want the ToolBox at the right side of the screen.

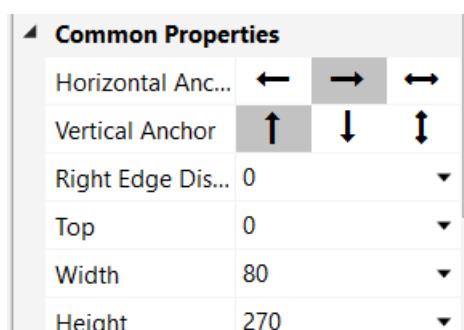

We:

- Reduce the width of ListView1 to get space for the Toolbox.
- Move pnlToolBox to the right side of the screen, change the Button heights and rearrange them vertically like in the picture.

- Select pnlToolBox

- Set the pnlToolBox Horizontal Anchor to . Set the Right Edge Distance to 0. Set the pnlToolBox vertical anchor to TOP. Adjust the button Height (60) and Top properties accordingly.

To always show pnlToolBox in the middle of the screen we add following code in the Script – Variant window.

For portrait:

Select the portrait variant.

And add this code

`pnlToolBox.HorizontalCenter = 50%x.`

For landscape :

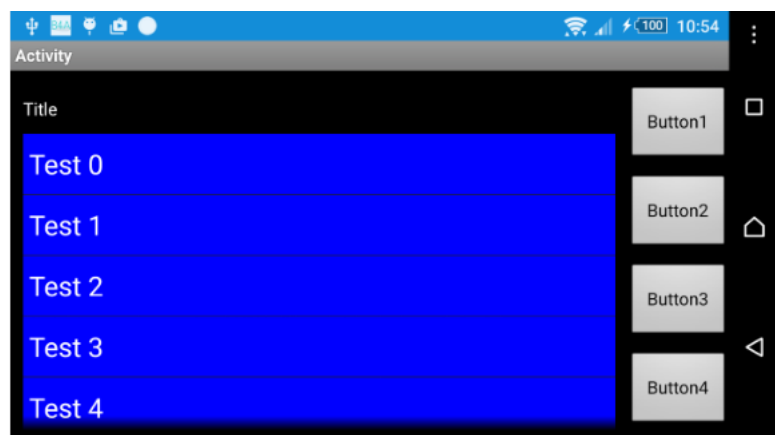

Select the landscape variant.

And add this code

`pnlToolBox.VerticalCenter = 50%y.`

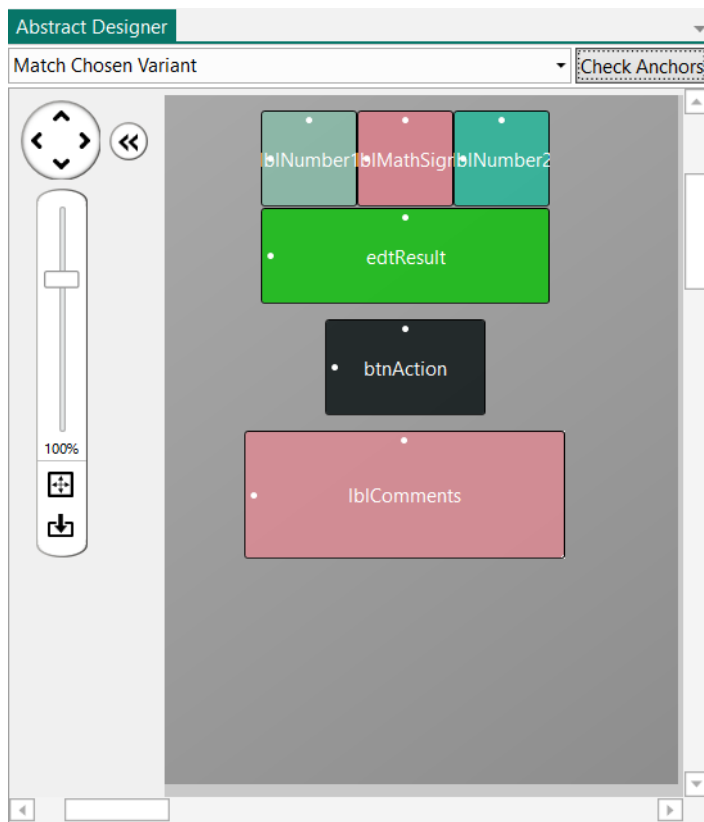

And the result on a device.

## 3.10 Abstract Designer

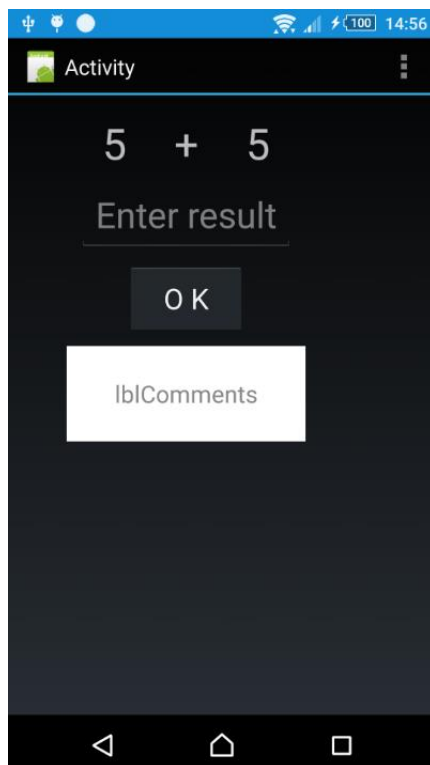

The Abstract Designer is a tool that shows the layout.

Its main purpose is to create different layout variants.

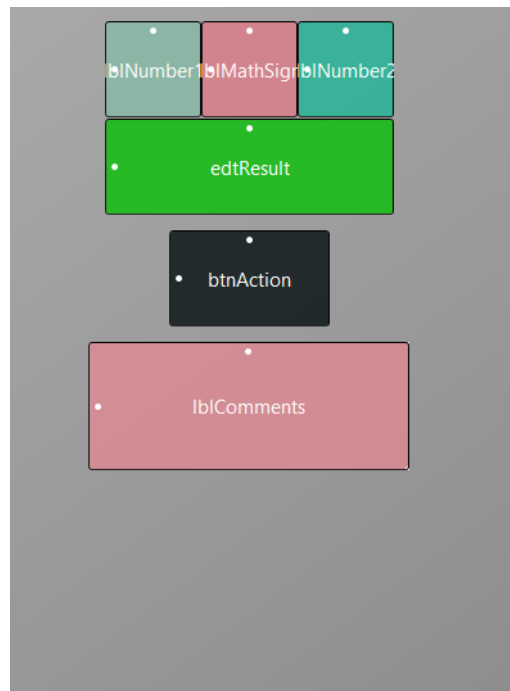

The different views are not shown with their exact shape but only as coloured rectangles.

Clicking on a view shows its properties in the Designer.

The images are made with the project MyFirstProgram.

Device

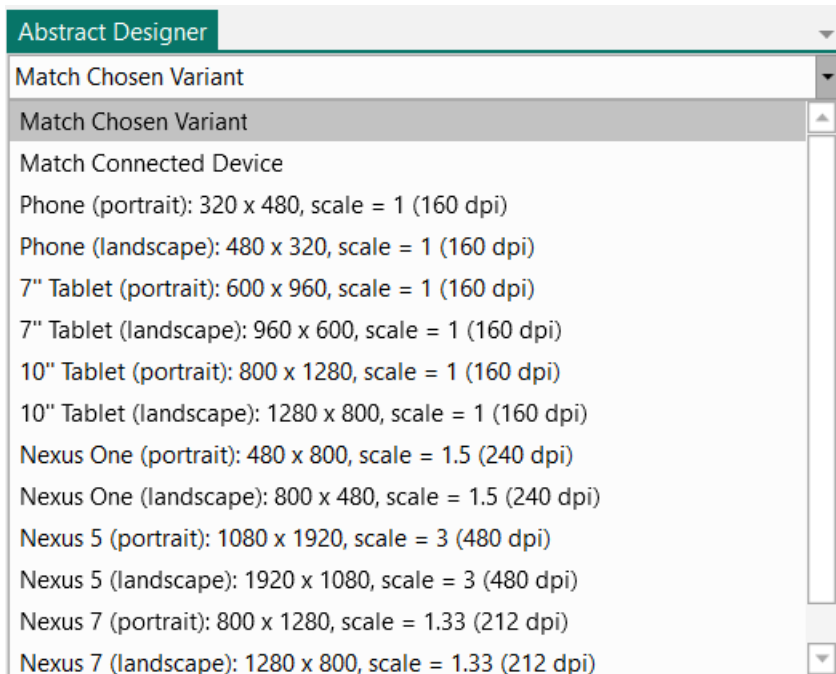

Abstract Designer

### 3.10.1 Selection of a screen size

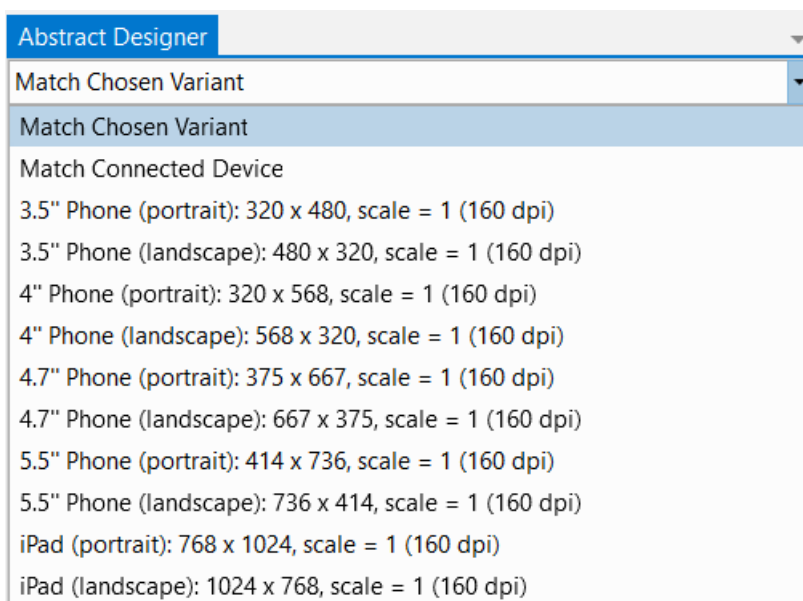

On top you can select different screen sizes:

#### 3.10.1.1 B4A Selection of a screen size

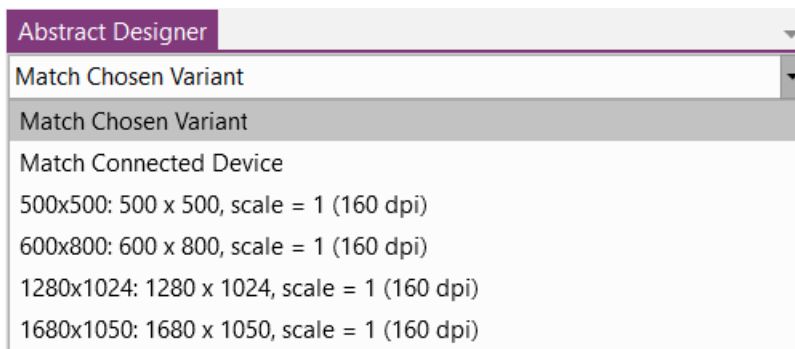

- Match chosen Variant.  
Matches the variant selected in the Variant window.
- Match Connected Device.  
Matches the size of the connected device or emulator.
- Different 'standard' sizes.  
This allows see how a layout looks on s different screen.

#### 3.10.1.2 B4i Selection of a screen size

- Match chosen Variant.  
Matches the variant selected in the Variant window.
- Match Connected Device.  
Matches the size of the connected device or emulator.
- Different 'standard' sizes.  
This allows see how a layout looks on s different screen.

**3.10.1.3 B4J Selection of a screen size**

- Match chosen Variant.  
Matches the variant selected in the Variant window.
- Match Connected Device.  
Matches the size of the connected device or emulator.
- Different 'standard' sizes.  
This allows see how a layout looks on s different screen.

### 3.10.2 Zoom

With  you can move the virtual screen in the four directions.

With  you can hide the zoom cursor and show it again with .

With the cursor you can set the zoom level you want.

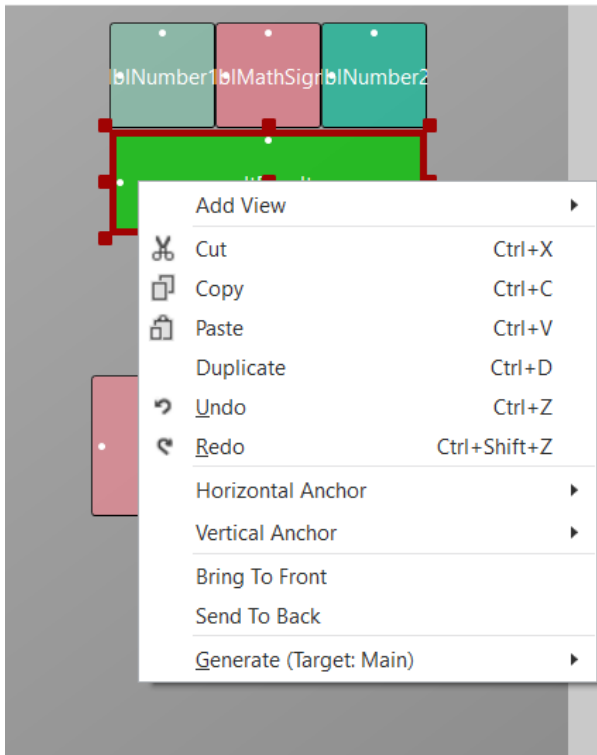

With  you can zoom to fit the selected screen size.

With  you can reset the zoom back to 100%.

With the bottom and side cursors you can move the layout vertically or horizontally.

### 3.10.3 Context menus

Right clicking on a view shows a context menu.

Add View

Cut

Copy

Paste

Duplicate

Undo

Redo

Horizontal Anchor

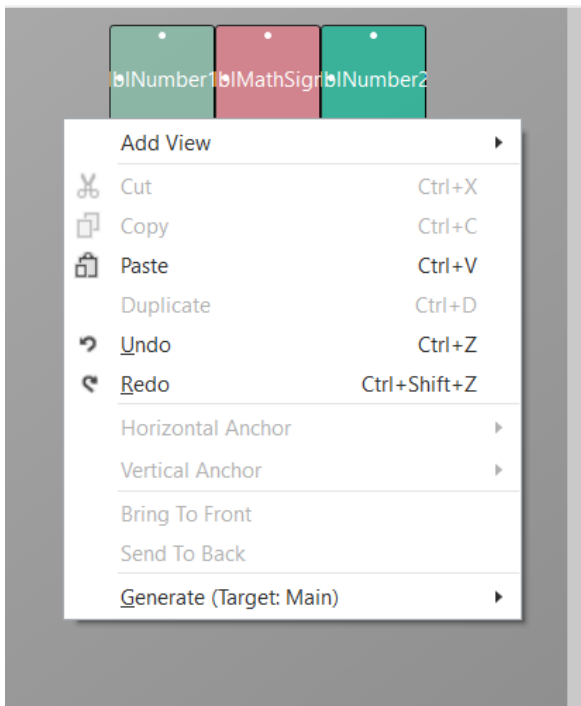

Vertical Anchor

Bring To Front

Send To Back

Generate (Target: Main)

Target: reminds you the current module active in the IDE, the Main module in this case.

Right clicking somewhere on Main area shows the context menu with some functions disabled which are not relevant for an Activity.

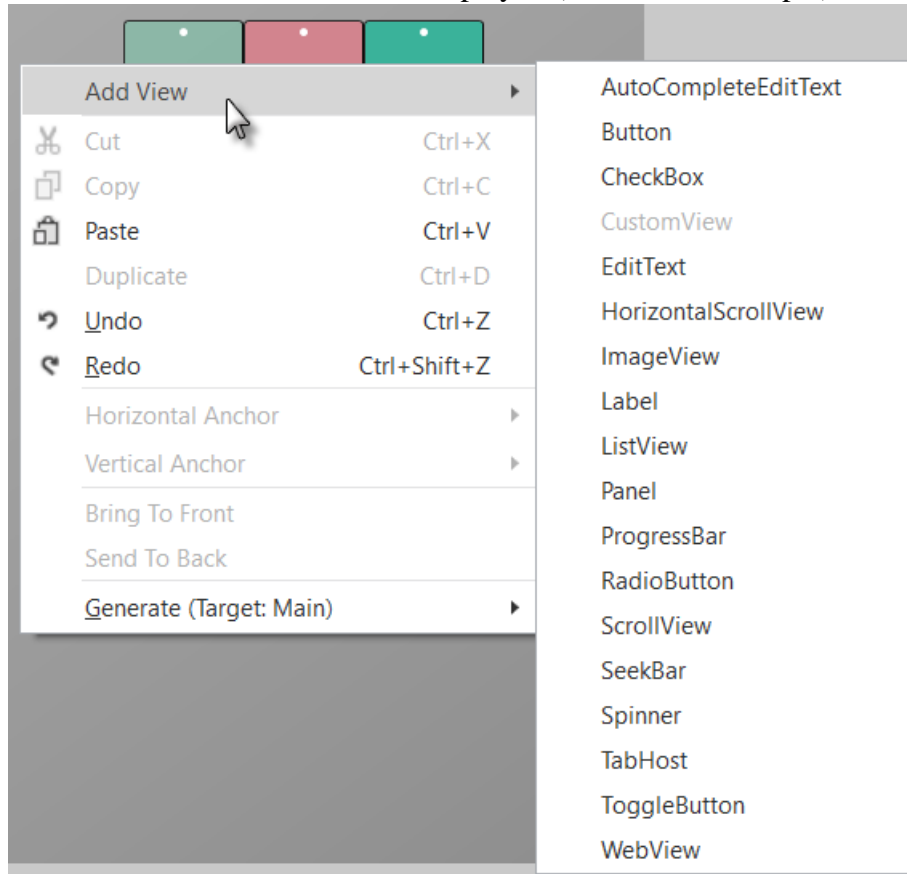

Only Add View, Paste, Undo, Redo and Generate are available.

### 3.10.3.1 Add View

Right click somewhere and move the cursor onto **Add View**.

This function is the same as the Add View function in the Visual Designer menu.

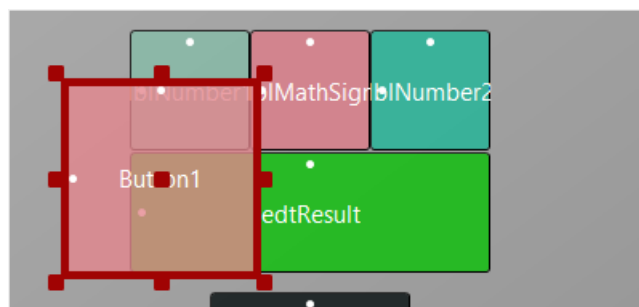

The list of all available views is displayed (B4A in the example).

Click on the desired view to add it.

Example for a Button.

The Button is added to the layout.

### 3.10.3.2 Cut

 **Cut** Ctrl+X removes the selected view from the layout.

If you selected a Panel, it will be removed with all its child views!

If you cut it by accident, click on  or press Ctrl+Z to recover it.

### 3.10.3.3 Copy

 **Copy** Ctrl+C copies the selected view into the clipboard.

If you selected a Panel, it will be copied with all its child views!

### 3.10.3.4 Paste

 **Paste** Ctrl+V copies the content of the clipboard.

If you selected a Panel, it will be pasted with all its child views!

Before you paste a view, you must select where you want to paste it. This can be either onto the Activity or onto a Panel.

### 3.10.3.5 Duplicate

**Duplicate** Ctrl+D Duplicates the selected view, it is added over itself.

Duplicate is a shortcut of Copy and Paste.

If you selected a Panel, it will be duplicated with all its child views!

### 3.10.3.6 Undo / Redo

 **Undo** Ctrl+Z  **Redo** Ctrl+Shift+Z

These two functions allow you to undo or redo the last operations.

### 3.10.3.7 Horizontal Anchor

You can set the horizontal anchor in the context menu instead of changing it in the Properties window.

The current anchor is checked.

### 3.10.3.8 Vertical Anchor

You can set the vertical anchor in the context menu instead of changing it in the Properties window.

The current anchor is checked.

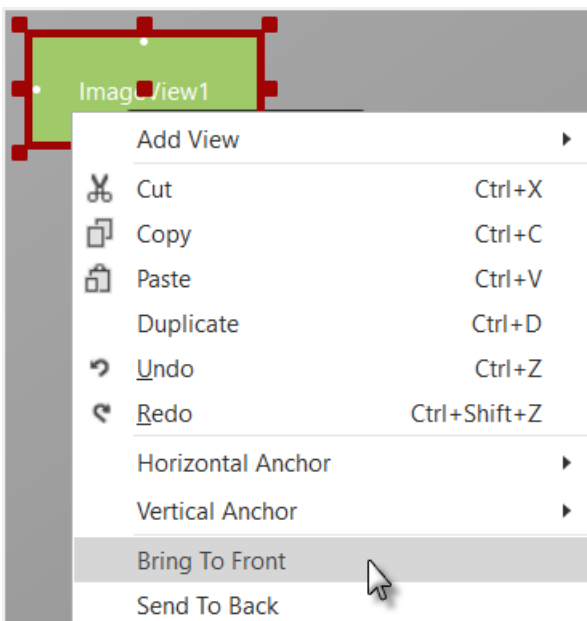

### 3.10.3.9 Bring To Front

Moves the selected View on top of the layout.

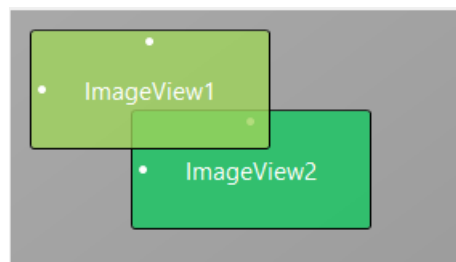

In the picture ImageView2 is over ImageView1. You see it with the border color.

Right click on ImageView1 and click on **Bring To Front** to move ImageView1 to front of all other views.

And the result:

### 3.10.3.10 Send To Back

**Send To Back** is the inverse function of Bring To Front function above.

### 3.10.3.11 Generate

**Generate** Generates the declaration statement or an event routine for the selected View. It is a shortcut of the [Generate Members](#) function in the VisualDesigner Tools menu but only for the selected view.

A popup menu allows you to select what code you want to generate; the possibilities depend on the type of the selected view.

Example with a Button (B4A):

#### Dim btnAction As Button

Generates the declaration statement in the Globals routine.

```
Private btnAction As Button
```

#### Dim btnAction As B4XView

Generates the declaration statement in the Globals routine.

```
Private btnAction As B4XView
```

#### Click

Generates the Click event routine frame.

```
Sub btnAction_Click
```

```
End Sub
```

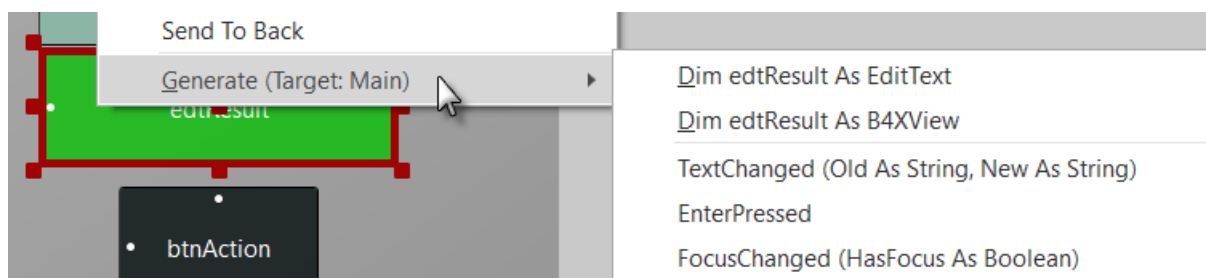

#### LongClick

Generates the LongClick event routine frame.

```
Sub btnTest1_LongClick
```

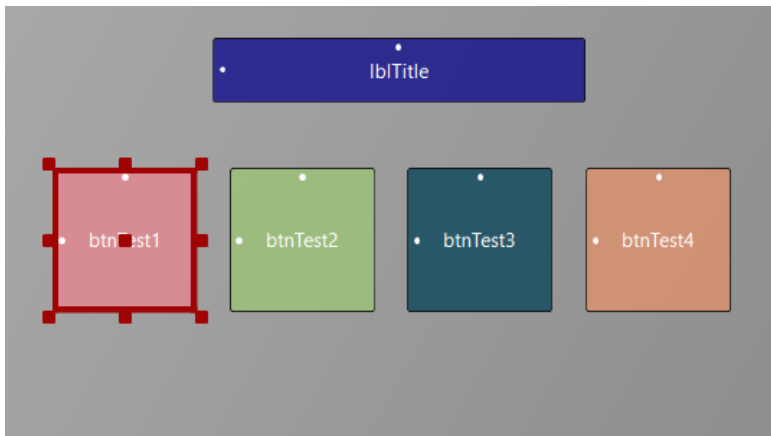

```
End Sub
```

Example with an EditText (B4A):

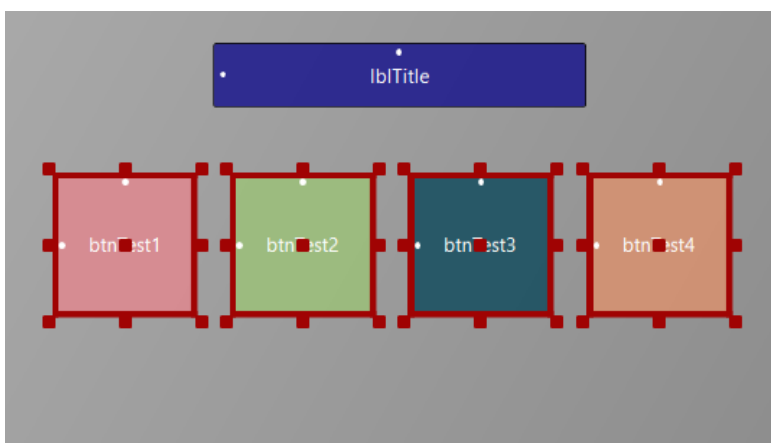

The context menu depends on the type of the product (B4A, B4i, B4J) and the type of the view.

### 3.10.4 Select views

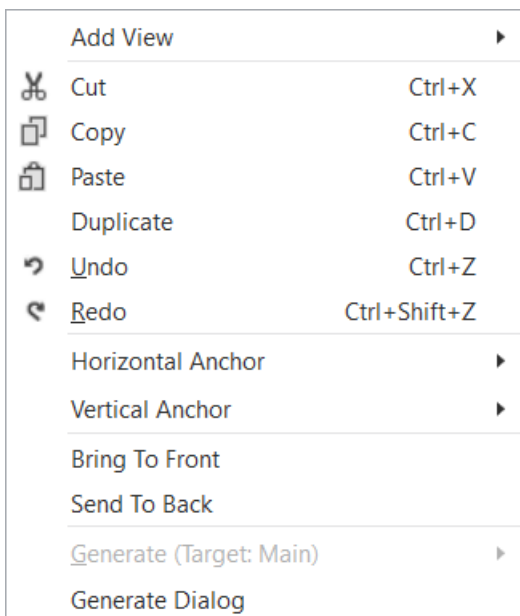

Select a single view:  
Click on the view

Select several views:  
Click on the first view.  
Press the Ctrl key,  
Click the following views.

The selected views are highlighted.

After the selection you can:

- Move the selected views with the arrow keys of the keyboard in the four directions.
- Right click on one of the selected view to show the context menu.

The functions are the same as for a single view, but a new function, **GenerateDialog**, is available to [Generate Members](#).

This is the same function as in the Visual Designer Tools menu but only for the selected views.

<b>Main</b>	
Type	Button
Event Name	
Parent	Activity
<b>Common Properties</b>	
Horizontal Anchor	← → ↔
Vertical Anchor	↑ ↓ ↕
Left	
Top	80
Width	100
Height	100
Padding	
Enabled	<input checked="" type="checkbox"/>
Visible	<input checked="" type="checkbox"/>
Tag	
Text	...
<b>Text Properties</b>	
Typeface	DEFAULT
Style	NORMAL
Horizontal Alignment	CENTER_HORIZONTAL
Vertical Alignment	CENTER_VERTICAL
Size	14
Text Color	<input checked="" type="checkbox"/> Default
Single Line	<input type="checkbox"/>
Ellipsize	NONE
<b>Button Properties</b>	
Drawable	
Pressed	<input type="checkbox"/>

• In the Properties window you can change all properties common to the selected views.

You can change the parent view.

You can change all these properties because they are the same for the four views selected in the example.

Changing, for example, the Height property will change it for all the selected views.

<b>Main</b>	
Type	
Event Name	
Parent	Activity
<b>Common Properties</b>	
Horizontal Anchor	← → ↔
Vertical Anchor	↑ ↓ ↕
Left	
Top	
Width	
Height	
Padding	
Enabled	<input checked="" type="checkbox"/>
Visible	<input checked="" type="checkbox"/>
Tag	
<b>Text Properties</b>	
Typeface	DEFAULT
Style	NORMAL
Horizontal Alignment	
Vertical Alignment	CENTER_VERTICAL
Size	14
Text Color	<input checked="" type="checkbox"/> Default
Single Line	<input type="checkbox"/>
Ellipsize	NONE
<b>Button Properties</b>	
Drawable	

If you select views of different types, only the properties common to the selected views can be changed.

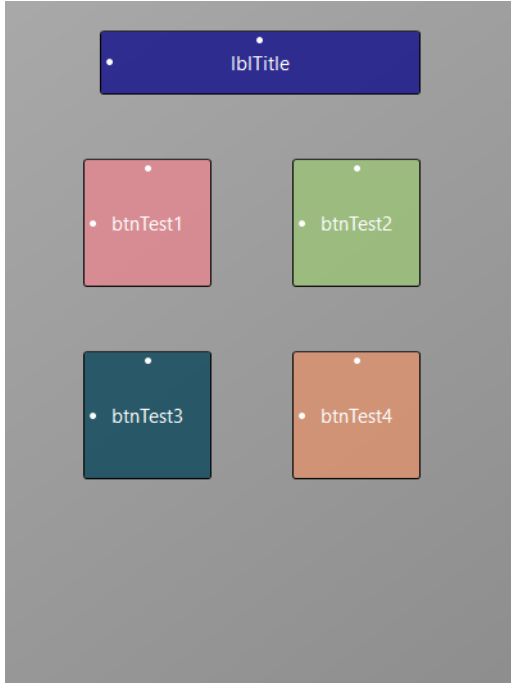

Example with a Label and a Button.

### 3.10.5 Example

Let us take a simple example with a layout in portrait mode, like the image below.

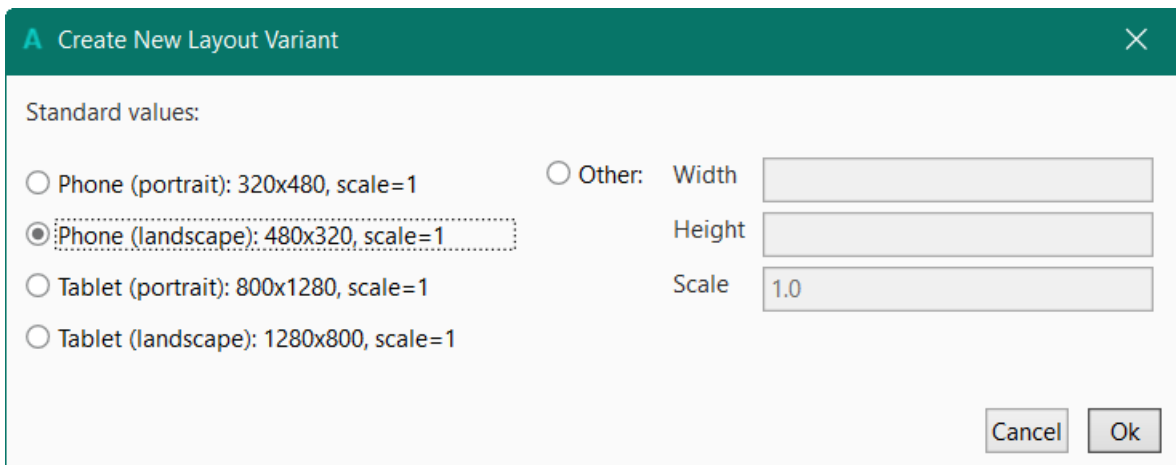

This example project is in the *Getting Started\SourceCode* folder in the *AbstractDesigner* subfolder. The example is for B4A, but the principle is the same for B4i and B4J.

Now we would like to make a landscape variant.

In the Variant window click on .

A selection window is displayed.

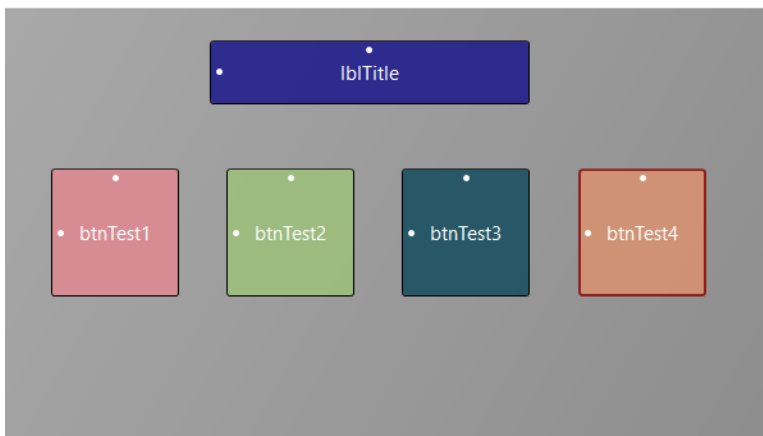

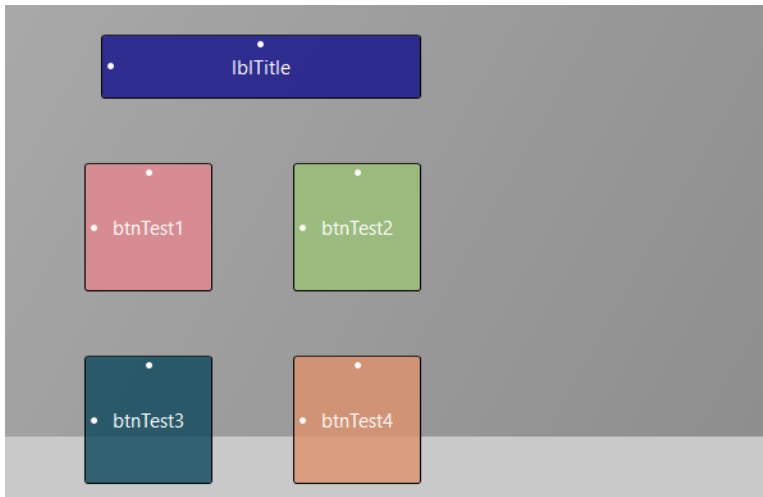

Select .

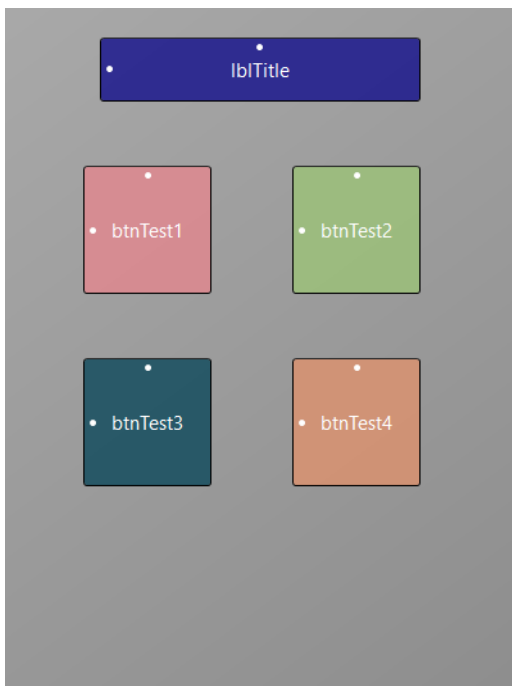

In the Variant window the new variant is displayed.

The Abstract Designer looks now like this:

Now we rearrange the views to fit the new orientation.

If you select in the Variant window the previous variant

you will see that layout.

### 3.11 Copy layouts cross platform between B4A, B4i and B4J

You can copy layouts between the three products B4A, B4i and B4J. Simply, select the views to copy and paste them wherever you want.

This allows you to build the layout on one platform and later copy all of it or parts of it to other platforms.

Each platform has unique controls. These cannot be copied. The same is true for unique properties that are not available in other platforms.

Custom views, and especially custom views that are built over XUI and are intended to be cross platform (example: [XUI Views](#)), can be shared with all their properties.

It is also possible to declare views as B4XViews directly from the designer. Note that custom views do not need to be declared as B4XViews. They should be declared with the custom type, which is cross platform.

Tip: you can always cast B4XViews to the explicit type and vice versa.

Instead of showing images here, it's more efficient to watch the [demo video in the forum](#).

A concrete example is explained in the [B4XPages Cross-platform projects booklet](#).

## 3.12 Adding views by code

It is also possible to add views by code instead of using the Designer with a device or the Abstract Designer.

- Advantage: You have full control of the view.
- Disadvantage: You must define almost everything and Anchors and AutoScale don't work.

**Note that you should avoid adding views in code but use the Designer with Anchors and Designer Scripts.**

### 3.12.1 B4A Adding views by code

The source code is in the source code directory: B4A\AddViewsByCode

For the positions and dimensions of the views on the screen two special options are available:

- **dip**                **density independent pixels.**  
 $100\text{dip} = \text{DipToCurrent}(100)$                  $\text{DipToCurrent}$  is a Keyword **dip** is the Shortcut  
 $100\text{dip} = 100 / 160 * \text{device density}$   
 The default density is 160 dpi **dots per inch** (pixels per inch)  
 Densities in Android:
  - 120    scale 0.75
  - 160    scale 1 default
  - 240    scale 1.5
  - 320    scale 2
- **%x** and **%y**    represent distances proportional to the active screen width and height.  
 $20\%x = 0.2 * \text{Activity.Width}$   
 $90\%y = 0.9 * \text{Activity.Height}$   
 $20\%x = \text{PerXToCurrent}(20)$                  $\text{PerXToCurrent}$  is a Keyword    **%x** is the Shortcut  
 $90\%y = \text{PerYToCurrent}(90)$

Example:

Let us put a Label on top of the screen and a Panel below it with a Label and a Button on it:

```
Sub Globals
    Private lblTitle, lblPanelTitle As Label
    Private pnlTest As Panel
    Private btnTest As Button
End Sub
```

```

Sub Activity_Create(FirstTime As Boolean)
    lblTitle.Initialize("")
    lblTitle.Color = Colors.Red
    lblTitle.TextSize = 20
    lblTitle.TextColor = Colors.Blue
    lblTitle.Gravity = Gravity.CENTER_HORIZONTAL + Gravity.CENTER_VERTICAL
    lblTitle.Text = "Title"
    Activity.AddView(lblTitle, 20%x, 10dip, 60%x, 30dip)

    pnlTest.Initialize("")
    pnlTest.Color = Colors.Blue

    btnTest.Initialize("btnTest")
    btnTest.Text = "Test"

    lblPanelTitle.Initialize("")
    lblPanelTitle.Color = Colors.Red
    lblPanelTitle.TextSize = 16
    lblPanelTitle.TextColor = Colors.Blue
    lblPanelTitle.Gravity = Gravity.CENTER_HORIZONTAL + Gravity.CENTER_VERTICAL
    lblPanelTitle.Text = "Panel test"

    Activity.AddView(pnlTest, 0, lblTitle.Top+lblTitle.Height+10dip, 100%x, 50%)
    pnlTest.AddView(lblPanelTitle, 20dip, 10dip, 100dip, 30dip)
    pnlTest.AddView(btnTest, 50dip, 50dip, 100dip, 60dip)
End Sub

```

Declaring the views.

```

Private lblTitle, lblPanelTitle As Label
Private pnlTest As Panel
Private btnTest As Button

```

Initializing the title label:

lblTitle.Initialize("")	Initializes the Label, no EventName required.
lblTitle.Color = Colors.Red	Sets the Background color to red.
lblTitle.TextSize = 20	Sets the text size to 20.
lblTitle.TextColor = Colors.Blue	Sets the text color to blue.
lblTitle.Gravity = Gravity.CENTER_HORIZONTAL + Gravity.CENTER_VERTICAL	Sets the label gravity.
lblTitle.Text = "Title"	Sets the label text to 'Title'.
Activity.AddView(lblTitle, 20%x, 10dip, 60%x, 30dip)	Adds the view to the activity.

If the Label had been added in the Designer, all the above code wouldn't have been necessary because the properties would already have been defined in the Designer.

In the Activity.AddView line we see that:

- the Left property is set to 20%x, 20% of Activity.Width.
- the Top property is set to 10dip, 10 density independent pixels.
- the Width property is set to 60%x, 60% of Activity.Width
- the Height property is set to 30dip, 30 density independent pixels.

pnlTest.Initialize("")	Initializes the Panel, no EventName required.
pnlTest.Color = Colors.Blue	Sets the Background color to blue.
btnTest.Initialize("btnTest")	Initializes the Button, EventName = btnTest.
btnTest.Text = "Test"	Sets the button text to "Test"
lblPanelTitle.Initialize("")	

```
lblPanelTitle.Color = Colors.Red  
lblPanelTitle.TextSize = 16  
lblPanelTitle.TextColor = Colors.Blue  
lblPanelTitle.Gravity = Gravity.CENTER_HORIZONTAL + Gravity.CENTER_VERTICAL  
lblPanelTitle.Text = "Panel test"
```

Similar to the title Label.

```
Activity.AddView(pnlTest,0,lblTitle.Top + lblTitle.Height + 10dip, 100%x, 50%y)
```

Adds the Panel pnlTest to the Activity.

- the Left property is set to 0
- the Top property is set to 10dips below the title Label
- the Width property is set to 100%x, the total Activity.Width
- the Height property is set to 50%y, half the Activity.Height

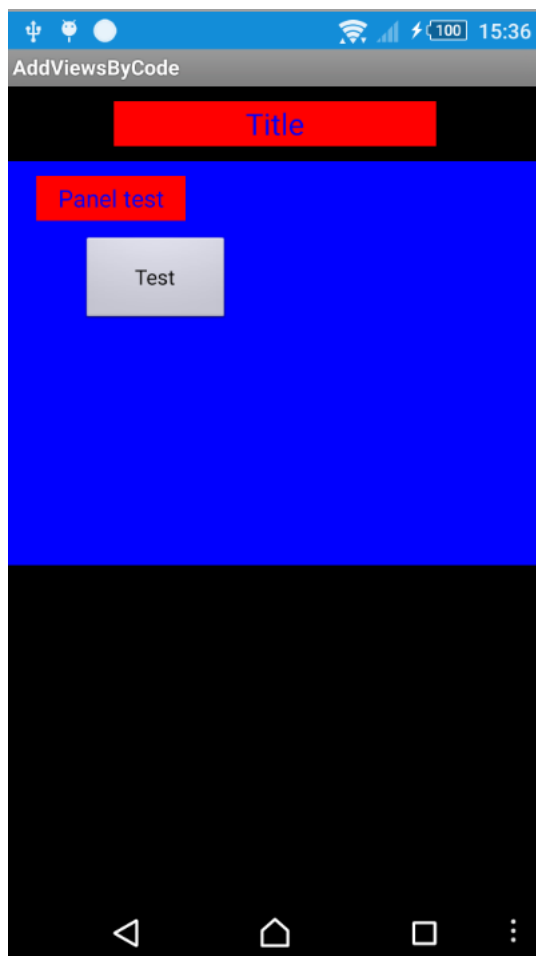

```
pnlTest.AddView(lblPanelTitle, 20dip, 10dip, 100dip, 30dip)
```

Adds the Label lblPanelTitle to the Panel pnlTest at the given position and with the given dimensions in dips.

```
pnlTest.AddView(btnTest, 50dip, 50dip, 100dip, 60dip)
```

Adds the Button btnTest to the Panel pnlTest at the given position and with the given dimensions in dips.

And the result on the device:

### 3.12.2 B4i Adding views by code

The source code is in the source code directory: B4i\AddViewsByCode

For the positions and dimensions of the views on the screen two options are available:

- Points, scale independent.  
The default density is 160 dpi **dots per inch** (pixels per inch).  
All coordinates refer to this density, iOS adapts the values internally to the scale.  
No *dip* values like in Android.
- %x and %y represent distances proportional to the current screen width and height.  
 $20\%x = 0.2 * \text{Page1.RootPanel.Width}$   
 $90\%y = 0.9 * \text{Page1.RootPanel.Height}$   
 $20\%x = \text{PerXToCurrent}(20)$       PerXToCurrent is a Keyword    %x is the Shortcut  
 $90\%y = \text{PerYToCurrent}(90)$

Example:

Let us put a Label on top of the screen and a Panel below it with a Label and a Button on it:

The whole code.

```

Sub Process_Globals
    Public App As Application
    Public NavControl As NavigationController
    Private Page1 As Page

    Private lblTitle, lblPanelTitle As Label
    Private pnlTest As Panel
    Private btnTest As Button
End Sub

Private Sub Application_Start (Nav As NavigationController)
    NavControl = Nav
    Page1.Initialize("Page1")
    Page1.Title = "Page 1"
    Page1.RootPanel.Color = Colors.White
    NavControl.ShowPage(Page1)

    lblTitle.Initialize("")
    lblTitle.Color = Colors.Red
    lblTitle.Font = Font.CreateNew(20)
    lblTitle.TextColor = Colors.Blue
    lblTitle.TextAlignment = lblTitle.ALIGNMENT_CENTER
    lblTitle.Text = "Title"

    pnlTest.Initialize("")
    pnlTest.Color = Colors.LightGray

    btnTest.InitializeCustom("btnTest", Colors.Black, Colors.Blue)
    btnTest.SetBorder(1, Colors.Black, 5)
    btnTest.Text = "Test"

    lblPanelTitle.Initialize("")
    lblPanelTitle.Color = Colors.Red
    lblPanelTitle.Font = Font.CreateNew(16)
    lblPanelTitle.TextColor = Colors.Blue
    lblPanelTitle.TextAlignment = lblPanelTitle.ALIGNMENT_CENTER
    lblPanelTitle.Text = "Panel test"
End Sub

Private Sub Page1_Resize(Width As Int, Height As Int)
    Page1.RootPanel.AddView(lblTitle, 20%x, 10, 60%x, 30)
    Page1.RootPanel.AddView(pnlTest, 10%x, lblTitle.Top + lblTitle.Height + 10, 80%x, 30%y)
    pnlTest.AddView(lblPanelTitle, 20, 10, 100, 30)
    pnlTest.AddView(btnTest, 50, 50, 100, 60)
End Sub

```

Code explanations:

Declaring the views in Process\_Globals.

```
Private lblTitle, lblPanelTitle As Label
Private pnlTest As Panel
Private btnTest As Button
```

Initializing the different views in Application\_Start:

```
lblTitle.Initialize("")           Initializes the Label, no EventName required.
lblTitle.Color = Colors.Red       Sets the Background color to red.
lblTitle.Font = Font.CreateNew(20) Sets the text size to 20.
lblTitle.TextColor = Colors.Blue  Sets the text color to blue.
lblPanelTitle.TextAlign = lblPanelTitle.ALIGNMENT_CENTER
                                Sets the label text alignment to 'CENTER'.
lblTitle.Text = "Title"           Sets the label text to 'Title'.
```

If the Label had been added in the Designer, all the above code wouldn't have been necessary because the properties would already have been defined in the Designer.

```
pnlTest.Initialize("")           Initializes the Panel, no EventName required.
pnlTest.Color = Colors.LightGray Sets the Background color to light gray.

btnTest.InitializeCustom("btnTest", Colors.Black, Colors.Blue)
Initializes the Button, EventName = btnTest, TextColor, PressedTextColor.
btnTest.SetBorder(1, Colors.Black, 5) Sets a Border with the given Width, Color and
                                CornerRadius.
btnTest.Text = "Test"           Sets the button text to "Test".

lblPanelTitle.Initialize("")
lblPanelTitle.Color = Colors.Red
lblPanelTitle.Font = Font.CreateNew(16)
lblPanelTitle.TextColor = Colors.Blue
lblPanelTitle.TextAlign = lblPanelTitle.ALIGNMENT_CENTER
lblPanelTitle.Text = "Panel test"
```

Similar to the title Label.

**Note that we add the views to their parent views in Page1\_Resize and not in Application\_Start because the real size of Page1.RootPanel is not known before!**

```
Private Sub Page1_Resize(Width As Int, Height As Int)
    Page1.RootPanel.AddView(lblTitle, 20%x, 10, 60%x, 30)
```

Adds the view to the Page1.RootPanel.

In the Page1.RootPanel.AddView line we set:

- the Left property to 20%x, 20% of Page1.RootPanel.Width,
- the Top property to 10, 10 points independent of the device scale,
- the Width property to 60%x, 60% of Page1.RootPanel.Width,
- the Height property to 30, 30 points independent of the device scale.

```
Page1.RootPanel1.AddView(pnlTest, 10%x, lblTitle.Top + lblTitle.Height + 10, 80%x, 30%y)
```

Adds the Panel pnlTest to the Page1.RootPanel.

- the Left property is set to 0
- the Top property is set to 10 points below the title Label
- the Width property is set to 100%x, the total Page1.RootPanel.Width
- the Height property is set to 30%y, 30% of the Page1.RootPanel.Height

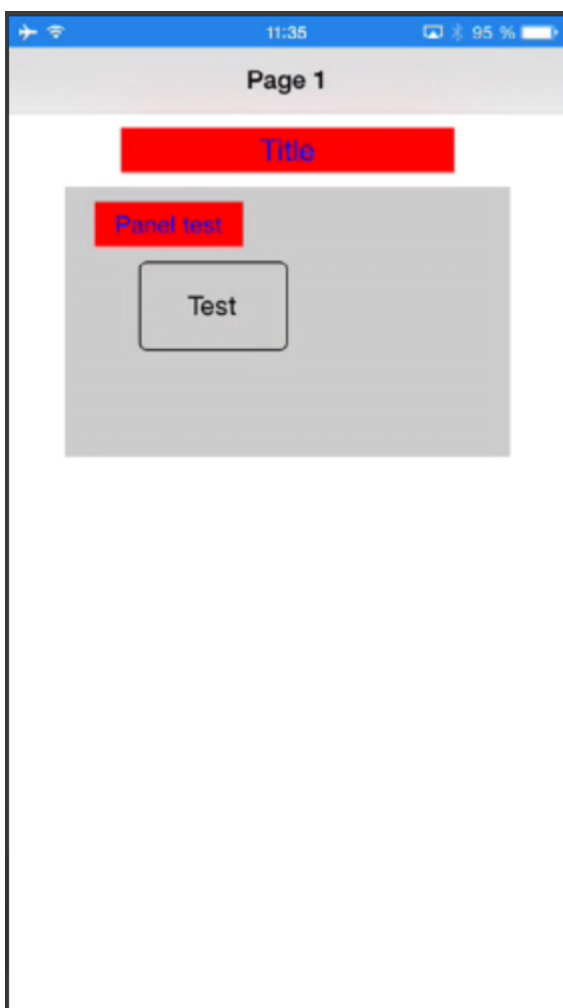

```
pnlTest.AddView(lblPanelTitle, 20, 10, 100, 30)
```

Adds Label lblPanelTitle to Panel pnlTest at the given position and with the given dimensions in points.

```
pnlTest.AddView(btnTest, 50, 50, 100, 60)
```

Adds Button btnTest to Panel pnlTest at the given position and with the given dimensions in points.

And the result:

### 3.12.3 B4J Adding views by code

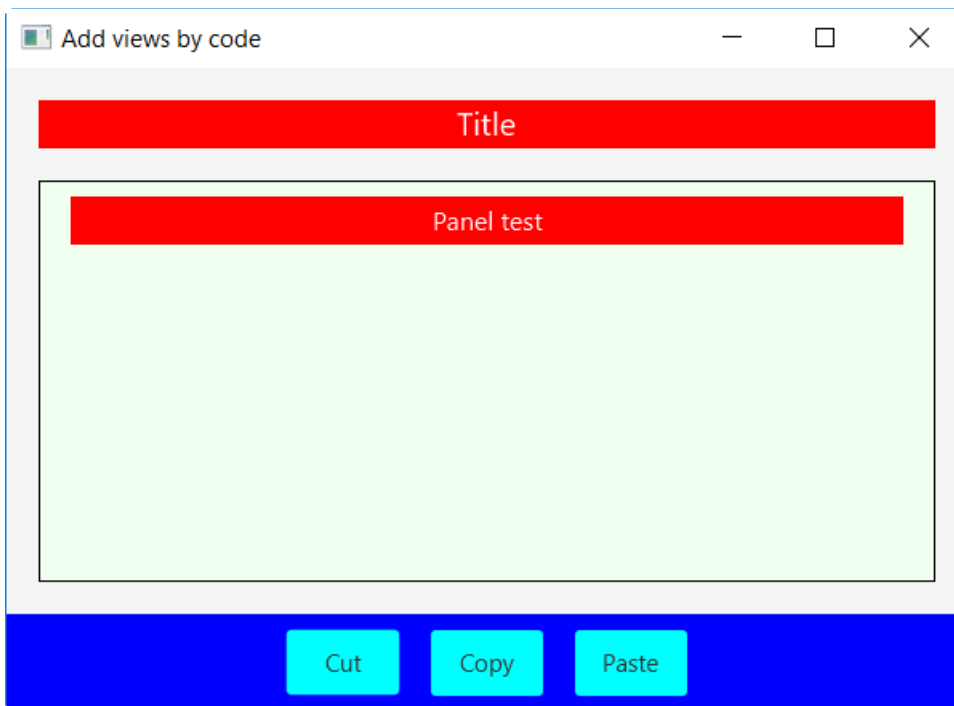

The source code is in the source code directory: B4J\AddViewsByCode

In B4J there are no dip, %x nor %y values, only pixel values.

If you want use %x and %y values, you must do it in the MainForm\_Resize event routine.  
The MainForm\_Resize event is also raised when the program starts, just after AppStart.

Example:

Let us put a Label on top of the form, a Pane below it with a Label on it and a Pane at the bottom of the form with three Buttons.

Code explanations:

Declaring the nodes in Process\_Globals.

```
Sub Process_Globals
    Private fx As JFX
    Private MainForm As Form

    Private lblTitle, lblPanelTitle As Label
    Private pnlTest, pnlTools As Pane
    Private btnCut, btnCopy, btnPaste As Button
End Sub
```

Initializing and adding the different nodes in AppStart:

```
MainForm.Title = "Add nodes by code"  Sets the Form title
MainForm.Resizable = True              Sets the Form being resizable.
MainForm.SetWindowSizeLimits(310, 300, 1200, 800)  Sets the min and max form sizes.
```

```
lblTitle.Initialize("")                Initializes the Label, no EventName required.
CSSUtils.SetBackgroundColor(lblTitle, fx.Colors.Red)  Sets the Background color to red.
lblTitle.TextSize = 20                 Sets the text size to 20.
lblTitle.TextColor = fx.Colors.White   Sets the text color to white.
lblTitle.Alignment = "CENTER"          Sets the label text alignment to 'CENTER'.
lblTitle.Text = "Title"                Sets the label text to 'Title'.
```

If the Label had been added in the Designer, all the above code wouldn't have been necessary because the properties would already have been defined in the Designer.

```
pnlTest.Initialize("")                 Initializes the Panel, no EventName required.
CSSUtils.SetBackgroundColor(pnlTest, fx.Colors.RGB(240, 255, 240))
                                         Sets the Background color to white.
CSSUtils.SetBorder(pnlTest, 1, fx.Colors.Black, 0)
                                         Sets the Border color to black and the corner radius to 0.
```

The rest of the initialization code is like the code above.

We add the nodes. In B4J Views are called Nodes, therefore AddNode instead of AddView.  
We add lblTitle, pnlTest and pnlTools to the MainForm.RootPane.

```
MainForm.RootPane.AddNode(lblTitle, 0.1 * 600, 10, 0.8 * 400, 30)
MainForm.RootPane.AddNode(pnlTest, 0.1 * 600, lblTitle.Top + lblTitle.Height + 10, 0.8 * 600, 0.8 * 400)
```

And we add lblPanelTitle to pnlTest and the buttons to pnlTools.

```
MainForm.RootPane.AddNode(lblTitle, 20, 20, 400, 30)
MainForm.RootPane.AddNode(pnlTest, 20, 20, 50, 50)
MainForm.RootPane.AddNode(pnlTools, 10, 10, 50, 60)
pnlTest.AddNode(lblPanelTitle, 20, 10, 100, 30)
pnlTools.AddNode(btnCut, 50, 10, 70, 40)
pnlTools.AddNode(btnCopy, 50, 10, 70, 40)
pnlTools.AddNode(btnPaste, 50, 10, 70, 40)
```

In the `Private Sub MainForm_Resize` routine we resize the nodes.

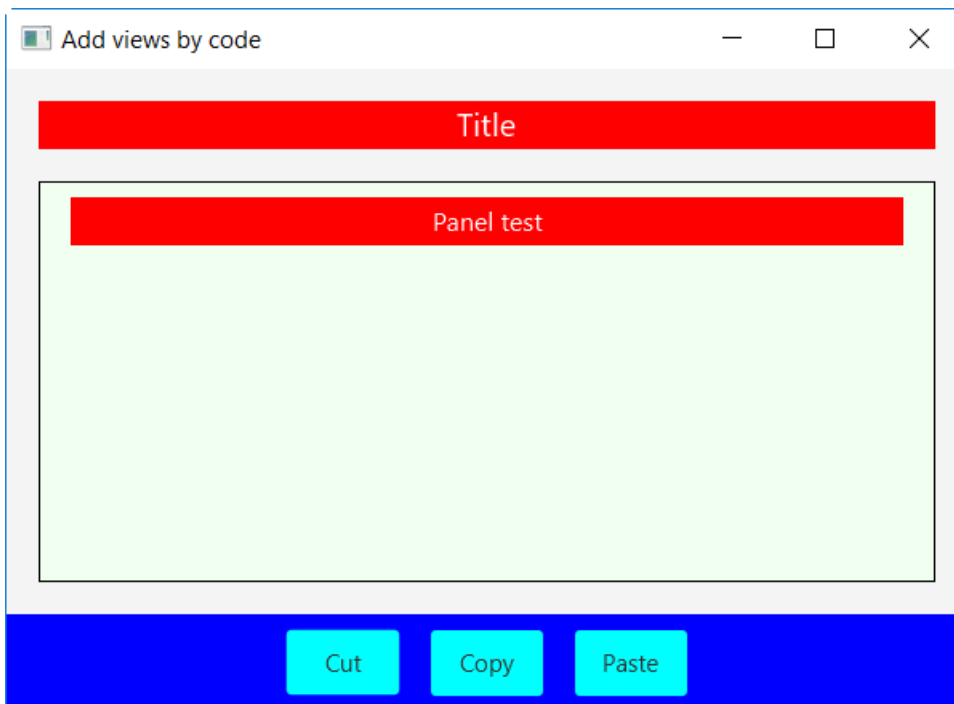

```
Private Sub MainForm_Resize (Width As Double, Height As Double)
    lblTitle.Left = 20
    lblTitle.SetSize(Width - 40, 30)

    pnlTools.Left = 0
    pnlTools.SetSize(Width, 60)
    pnlTools.Top = Height - pnlTools.Height

    pnlTest.Left = lblTitle.Left
    pnlTest.Top = lblTitle.Top + lblTitle.Height + 20
    pnlTest.SetSize(Width - 40, pnlTools.Top - lblTitle.Height - 60)

    lblPanelTitle.Left = 20
    lblPanelTitle.SetSize(Width - 80, 30)

    btnCopy.Left = (Width - btnCopy.Width) / 2
    btnCut.Left = btnCopy.Left - btnCut.Width - 20
    btnPaste.Left = btnCopy.Left + btnCut.Width + 20
End Sub
```

And the result:

The positions and sizes are adjusted to the form size.

Or resized to the minimum size.

**The same can be better done in the Designer with anchors and Designer Scripts! See next chapters.**

## 3.13 Anchors

The Horizontal Anchor and Vertical Anchor properties are very powerful to adapt to different screen sizes.

### 3.13.1 Horizontal Anchor

Common Properties			
Horizontal Anchor			
Vertical Anchor			

The horizontal anchor property can take three values:

-  LEFT

Common Properties			
Horizontal Anchor			
Vertical Anchor			
Left			▼
Top			▼
Width			▼
Height			▼

This is the default value.

The left edge is anchored to the left edge of the parent view with the distance given in the Left property.

Left and Top anchors are shown.

-  RIGHT

Common Properties			
Horizontal Anchor			
Vertical Anchor			
Right Edge Distance			▼
Top			▼
Width			▼
Height			▼

The right edge is anchored to the right edge of the parent view with the distance given in the Right Edge Distance property.

The Left property is no longer available because it is defined by the width and the right anchor!

The dot on top and on the right edge show the anchors.

-  BOTH

Common Properties			
Horizontal Anchor			
Vertical Anchor			
Left			▼
Top			▼
Right Edge Distance			▼
Height			▼

Both edges are anchored.

The Width property is no longer available because it is defined by the anchors!

Setting the Horizontal Anchor property to BOTH is like using the SetLeftAndRight function in the Designer Scripts.

The dots on top and on the two edges show the anchors.

### 3.13.2 Vertical Anchor

Common Properties			
Horizontal Anchor	←	→	↔
Vertical Anchor	↑	↓	↕
Left			▼
Top			▼

The vertical anchor property can take three values:

-  TOP

Common Properties			
Horizontal Anchor	←	→	↔
Vertical Anchor	↑	↓	↕
Left			▼
Top			▼
Width			▼
Height			▼

This is the default value.

The top edge is anchored to the top edge of the parent view with the distance given in the Top property.

Left and Top anchors are shown.

-  BOTTOM

Common Properties			
Horizontal Anchor	←	→	↔
Vertical Anchor	↑	↓	↕
Left			▼
Bottom Edge Distan...			▼
Width			▼
Height			▼

The bottom edge is anchored to the bottom edge of the parent view with the distance given in the Bottom Edge Distance property.

The Top property is no longer available because it is defined by the Height and the bottom anchor!

The dot on the left and on the bottom edge show the anchors.

-  BOTH

Common Properties			
Horizontal Anchor	←	→	↔
Vertical Anchor	↑	↓	↕
Left			▼
Top			▼
Width			▼
Bottom Edge Distan...			▼

Both edges are anchored.

The Height property is no longer available because it is defined by the anchors!

Setting the Vertical Anchor property to BOTH is like using the SetTopAndBottom function in the Designer Scripts.

The dots on the left and the two edges show the anchors.

What happens when we set the horizontal anchor of the two views below to BOTH and change the parent view width?

The left view's right edge is anchored to the right edge of the parent view with the Right Edge Distance.

The right view's left edge is anchored to the left edge of the parent view with the Left distance.

If we increase the width of the parent view, we get the layout below.

The left view's right edge is still at the Right Edge Distance from the parent view's right edge.

The right view's left edge is still at the Left distance from the parent view's left edge.

The result is an overlapping of both views.

In this case you must adjust the views in the Designer Scripts with the `SetLeftAndRight` method!

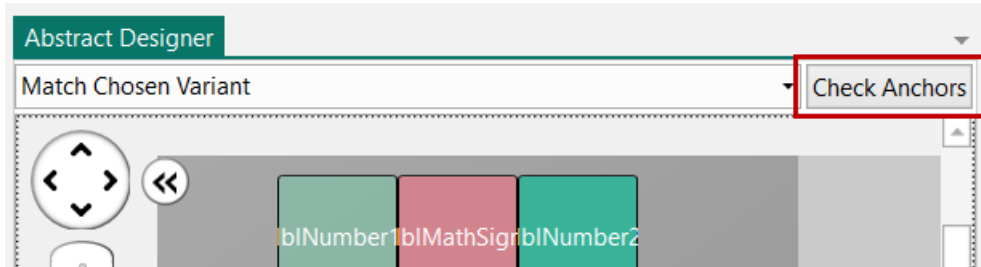

For example:

```
LeftView.SetLeftAndRight(0, 67%x)
```

```
RightView.SetLeftAndRight(33%x, 100%x)
```

### 3.13.3 AnchorChecker

In the top right corner of the Abstract Designer, you find the **Check Anchors** button to check if the anchors are coherent.

When you click on **Check Anchors** all views with noncoherent anchors are displayed in red.

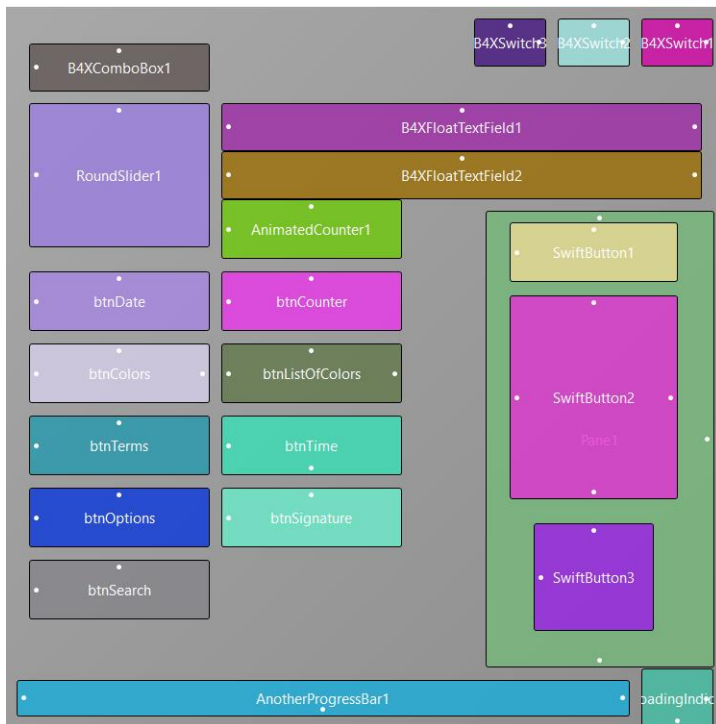

Otherwise, you'll get this message.

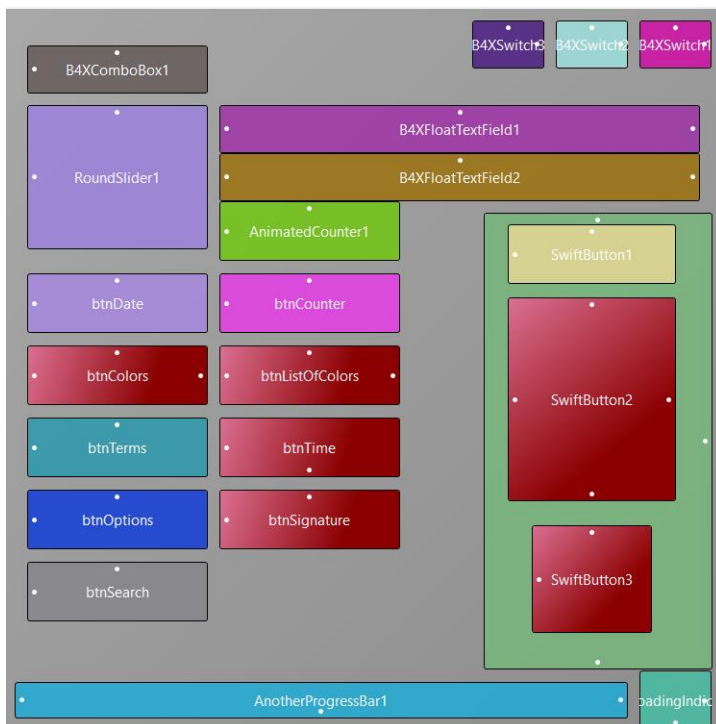

Example with ‘wrong’ anchors.

The B4J source code is in the *Getting Started\SourceCode\CheckAnchors* folder.

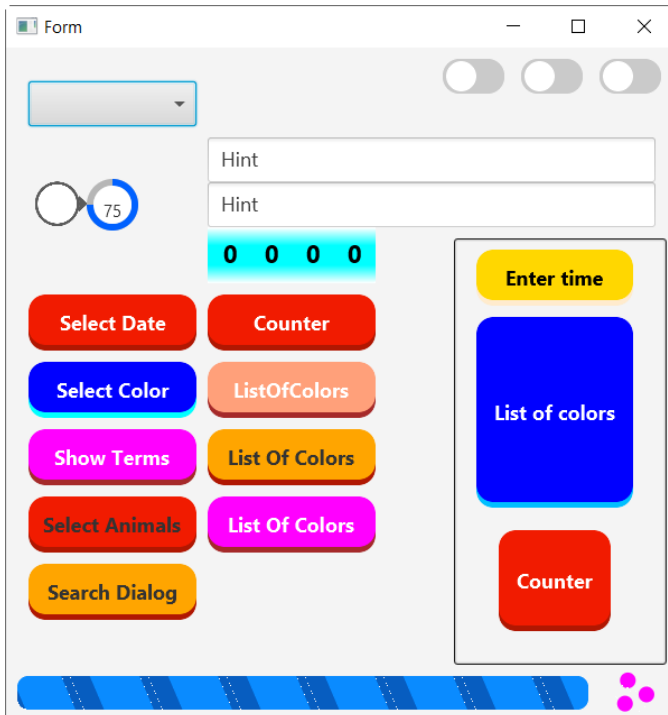

The layout:

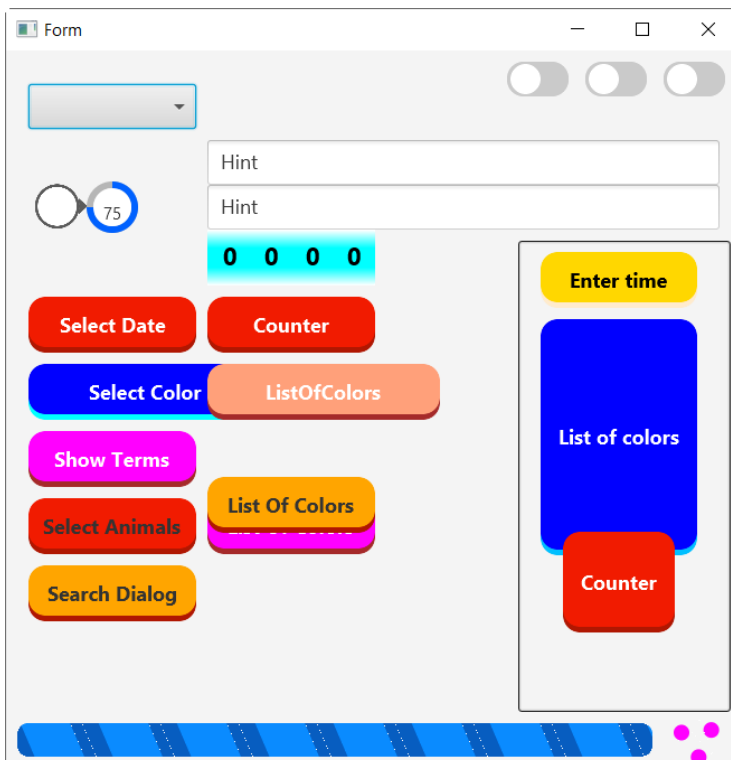

After the click on **Check Anchors** :

Screenshot of the result.

And after stretching the window horizontally and vertically:

You may have a look at this thread in the forum, it shows an animation:

<https://www.b4x.com/android/forum/threads/new-feature-anchors-checker.108805/>

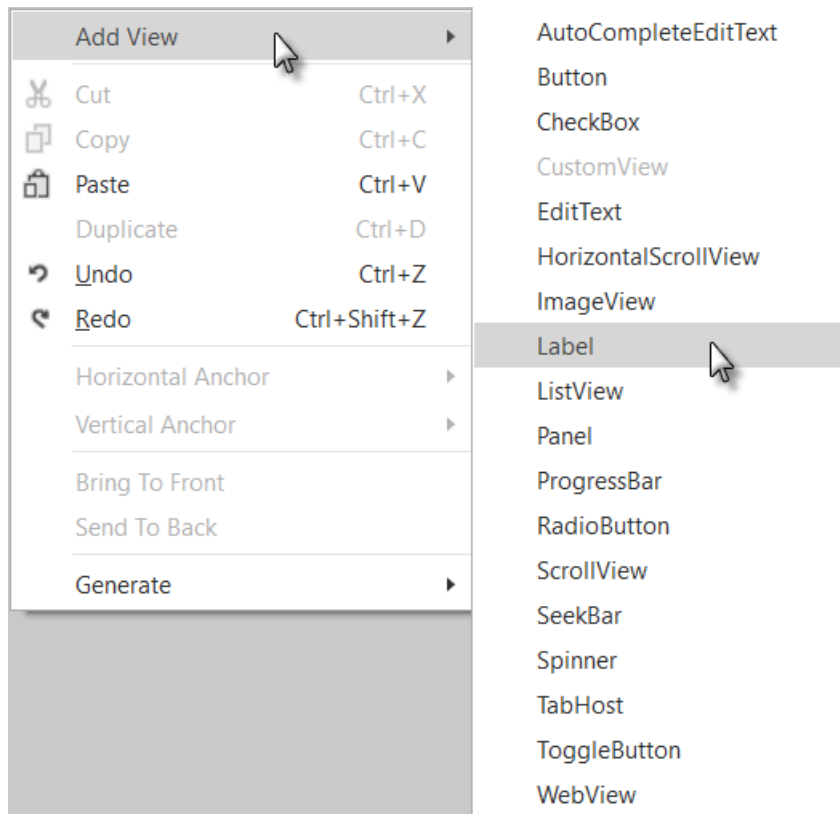

### 3.13.4 Example project

The examples shown in this chapter are based on the *DesignerAnchor* project. The source code is in the *Getting Started\SourceCode\DesignerAnchor* folder.

The example is made with B4A, but the principle is exactly the same with B4i and B4J

First, we add a label on top of the screen which should cover the whole width and stay on top.

In the AbstractDesigner right-click somewhere on the screen, the menu below will be displayed:

Click on **Add View**.

On the left side appears the list of the views you can add to the layout.

Click on **Label**.

The Label is added.

Move the label's upper left corner to the upper left corner of the screen and stretch it to fill the whole width of the screen.

Click somewhere else on the screen to remove the red anchors.

The left and top anchors are displayed.

Common Properties		
Horizontal Anchor		
Vertical Anchor		
Left	0	▼
Top	0	▼
Width	320	▼
Height	40	▼

Click again on the Label and we see these properties:

Left = 0

Top = 0

Width = 320 full layout width

Height = 40

Common Properties		
Horizontal Anchor		
Vertical Anchor		

Now we change the 'Horizontal Anchor' property:

Click on  BOTH.

Common Properties		
Horizontal Anchor		
Vertical Anchor		
Left	0	▼
Top	0	▼
Right Edge Dista...	0	▼
Height	40	▼

We see that the properties changed:

Left, Top and Height are still the same.

But Width has disappeared and is replaced by Right Edge Distance = 0

Its value = 0 because the right edge is on the right edge of the screen.

Text Properties		
Typeface	DEFAULT	▼
Style	NORMAL	▼
Horizontal Ali...	CENTER_HORIZONTAL	▼
Vertical Align...	CENTER_VERTICAL	▼
Size	18	▼
Text Color	 #FFFFFF	▼
Single Line	<input type="checkbox"/>	
Ellipsize	NONE	▼
Label Properties		
Drawable	ColorDrawable	▼
Color	 #FF00008B	▼
Corner Rad...	0	▼
Border Color	 #FF000000	▼
Border Wid...	0	▼

Set the other properties like in the picture.

Now we see the top anchor and the anchors on the left and the right edge.

Now, let us add a Panel at the bottom of the screen covering also the whole screen width.

The properties look like in the picture.

Common Properties	
Horizontal Anchor	← → ↔
Vertical Anchor	↑ ↓ ↔
Left	0
Top	370
Width	320
Height	60

We set the Horizontal Anchor to BOTH. Same as for Label1.

Common Properties	
Horizontal Anchor	← → ↔
Vertical Anchor	↑ ↓ ↔
Left	0
Top	370
Right Edge Dista...	0
Height	60

Common Properties	
Horizontal An...	← → ↔
Vertical Anchor	↑ ↓ ↔
Left	0
Bottom Edge...	0
Right Edge Di...	0
Height	60
Padding	
Enabled	<input checked="" type="checkbox"/>
Visible	<input checked="" type="checkbox"/>
Tag	
Panel Properties	
Elevation	0
Drawable	ColorDrawable
Color	#FF00008B
Corner Rad...	0
Border Color	#FF000000
Border Wid...	0

We set the Vertical Anchor to  BOTTOM.

The Top property is replaced by the:

Bottom Edge Distance = 0 property.

Its value = 0 because we anchor the bottom edge of Panel1 to the screens bottom edge.

We see the three anchors.

And set the other properties like this.

Now we add a second label onto Panel1.

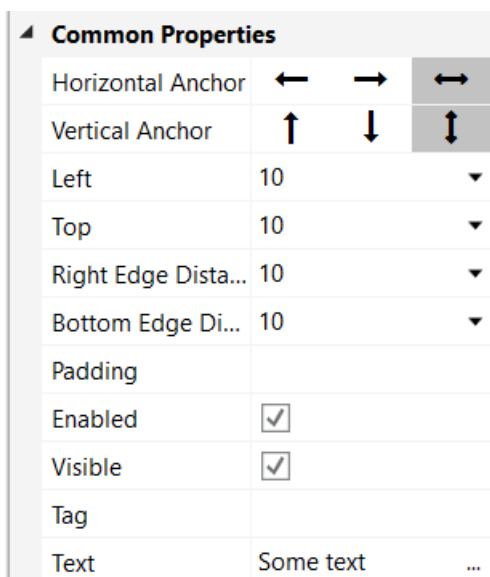

Click on Panel1 to select it.

Add the label.

Move and size the label like in the picture with the Left, Top, Width and Height properties like in the list below.

In the Views Tree window, we see that Label2 is shifted to the right because its parent view is Panel1 and not the Activity like for Label1 and Panel1!

Set the Horizontal and Vertical Anchors to

The properties

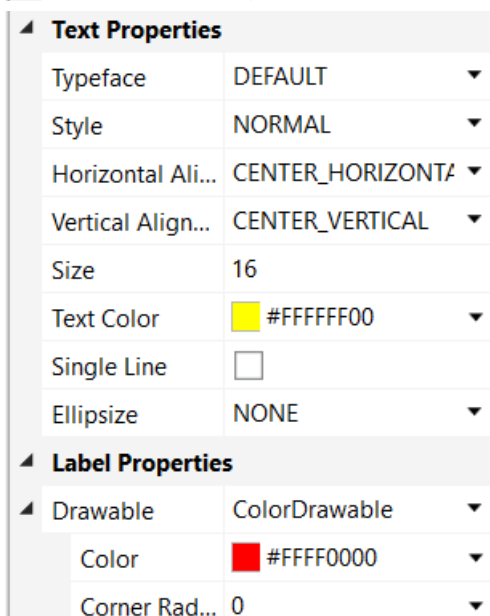

Left = 10 and

Top = 10 remain the same.

Right Edge Distance = 10 and

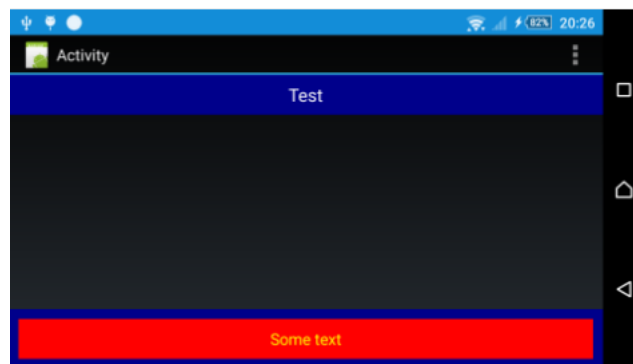

Bottom Edge Distance = 10

The two values are equal to 10 because we want a 'frame' around Label2.

Set the other properties like in the picture.

And the result looks like the pictures below in portrait and landscape screen orientations.

To demonstrate the anchor feature we move, in the Abstract Designer, the top edge of Panel1 upwards.

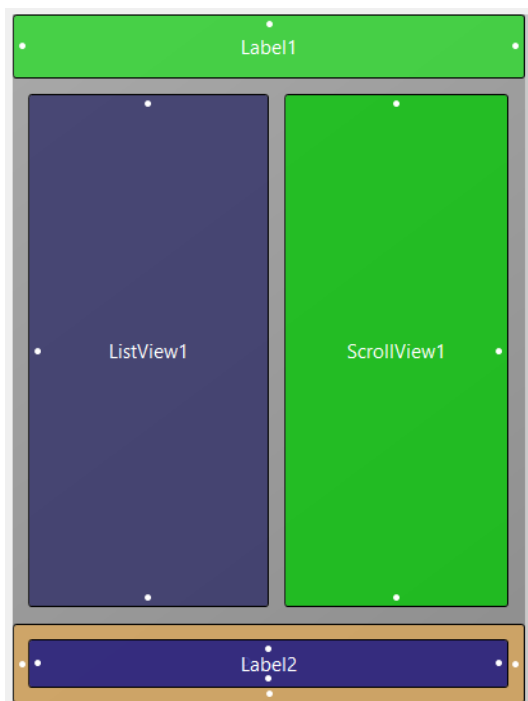

We see that the bottom edge of Label2 remains at its place!

Now, we add a ListView onto the left half of the screen and vertically positioned between Label1 and Panel1 leaving a small space.

Common Properties	
Horizontal Anch...	← → ↔
Vertical Anchor	↑ ↓ ↔
Left	10
Top	50
Width	150
Bottom Edge Di...	70
Padding	
Enabled	<input checked="" type="checkbox"/>
Visible	<input checked="" type="checkbox"/>
Tag	
ListView Properties	
Drawable	ColorDrawable
Color	#FF006400
FastScrollEnabled	<input type="checkbox"/>

We set the vertical anchor to **BOTH**. And set the other properties like in the picture.

Now, we add a ScrollView on the right half of the screen also positioned between Label1 and Panel1 leaving a small space.

Common Properties	
Horizontal Anch...	← → ↔
Vertical Anchor	↑ ↓ ↔
Right Edge Dist...	10
Top	50
Width	140
Bottom Edge Di...	70
Padding	
Enabled	<input checked="" type="checkbox"/>
Visible	<input checked="" type="checkbox"/>
Tag	
ScrollView Properties	
Drawable	ColorDrawable
Color	#FFFFFF00
Corner Radius	0
Border Color	#FF000000
Border Width	0
Inner Height	500

We set the horizontal anchor to **RIGHT**. We set the vertical anchor to **BOTH**. And set the other properties like in the picture.

In the code we:

- Load the layout.
- Fill the ListView and the ScrollView.

```
Sub Activity_Create(FirstTime As Boolean)
    Activity.LoadLayout("Main")
    FillListView
    FillScrollView
End Sub
```

The two filling routines.

```
Sub FillListView
    Private i As Int

    For i = 0 To 20
        ListView1.AddSingleLine("Test " & i)
    Next
End Sub
```

```
Sub FillScrollView
    Private i As Int
    Private lblHeight = 30dip As Int

    For i = 0 To 20
        Private lbl As Label
        lbl.Initialize("lbl")
        ScrollView1.Panel.AddView(lbl, 0, i*lblHeight, 100%-20dip, lblHeight-1dip)
        lbl.Color = Colors.Blue
        lbl.TextColor = Colors.White
        lbl.Text = "Test " & i
        lbl.Tag = i
    Next
    ScrollView1.Panel.Height = i * lblHeight
End Sub
```

And the result:

In portrait and landscape screen orientations.

We see that the anchors work fine.  
But we see that there is a big gap between the  
ListView and the ScrollView.

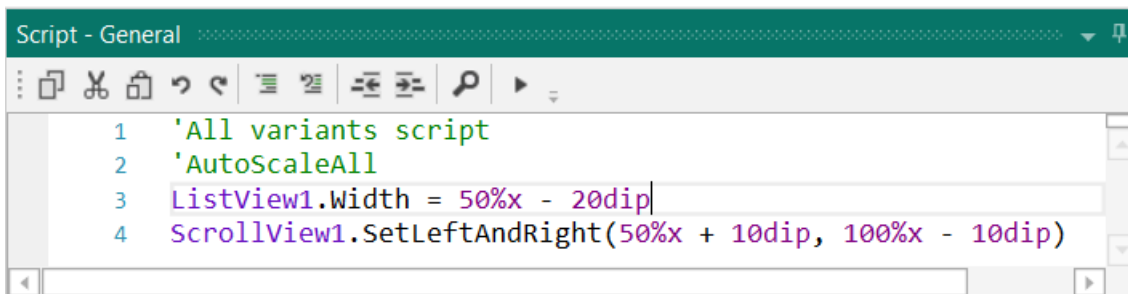

Why do we have this gap?

Because we set the Horizontal Anchor of the ListView to LEFT and the Horizontal Anchor of the ScrollView to RIGHT.

But the Width property remains the same and that's why we get the gap between the two views when the screen width is wider than the layout screen width.

To adjust the width, we add two lines in the DesignerScripts.

Click on  to show the DesignerScripts window.

Here we comment AutoScaleAll and add the following two lines:

```
'AutoScaleAll
ListView1.Width = 50%x - 20dip
ScrollView1.SetLeftAndRight(50%x + 10dip, 100%x - 10dip)
```

The anchors are valid in the AbstractDesigner but not in Designer Scripts.

For ListView1 it's enough to set its Width property.

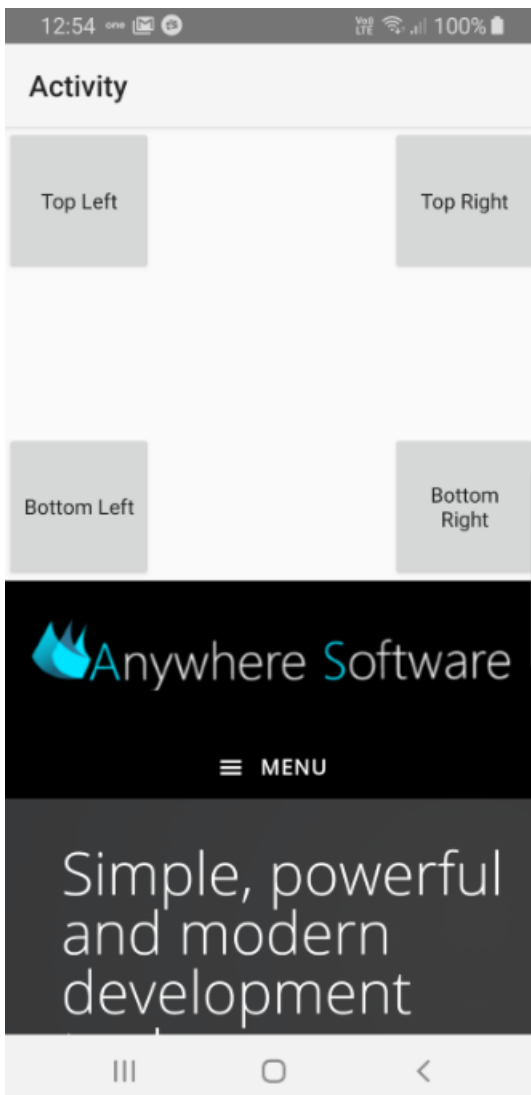

But for ScrollView1 we need to define both properties Left and Right which is done with SetLeftAndRight because the RIGHT anchor is lost.

And the new result in landscape orientation.

### 3.13.5 Nested layouts

Let's say that we want to build a layout such as below where the screen is split into two halves.

If we try to build this layout with a single layout file, we will quickly meet a problem. We will add this designer script to split the screen:

```
pnlTop.SetTopAndBottom(0, 50%)  
pnlBottom.SetTopAndBottom(50%, 100%)
```

The problem is that anchors are applied right before the designer script is executed, so the anchors will not be updated when the panels are resized.

This means that we will not be able to use anchors and will need to set the size of all the views in the designer script.

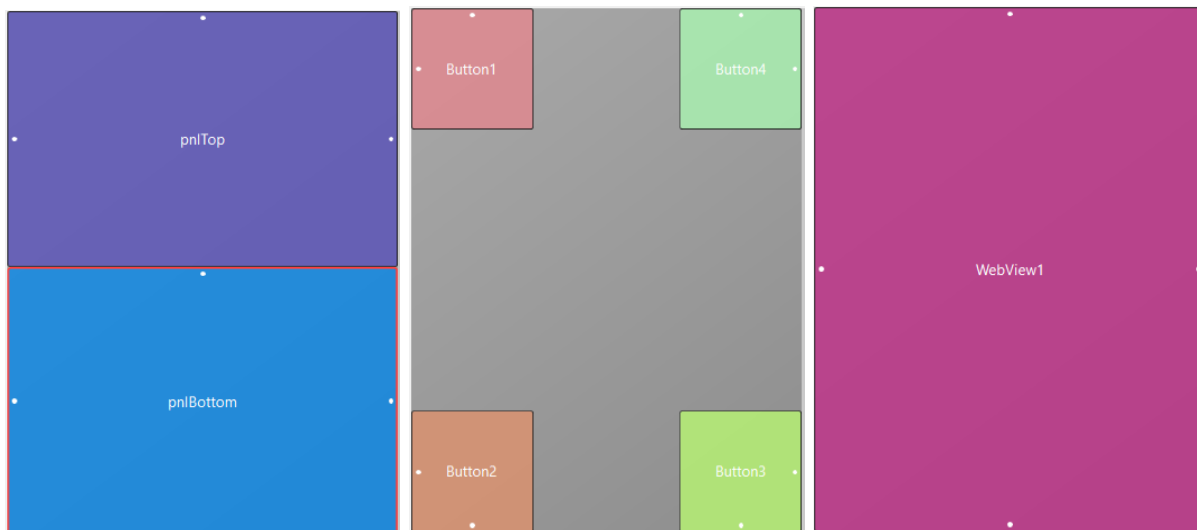

However, there is a better solution, we can split the layout into three nice and clean layout files and load them with:

```
Sub Globals
    Private WebView1 As WebView
    Private pnlTop As B4XView
    Private pnlBottom As B4XView
End Sub

Sub Activity_Create(FirstTime As Boolean)
    Activity.LoadLayout("Main")
    pnlTop.LoadLayout("Top")
    pnlBottom.LoadLayout("Bottom")
    WebView1.LoadUrl("https://www.b4x.com")
End Sub
```

The only designer script needed is for the two panels in the main layout.

Note that the variant size doesn't matter. The nested layouts will be resized based on the parent panels sizes. Look also at the anchors.

Main lyout

Top layout

Bottom layout

## 3.14 Designer Scripts

One of the most common issues that Android and iOS developers face is the need to adapt the user interface to devices with different screen sizes, it is much less important in B4J.

As described in the visual designer tutorial, you can create multiple layout variants to match different screens.

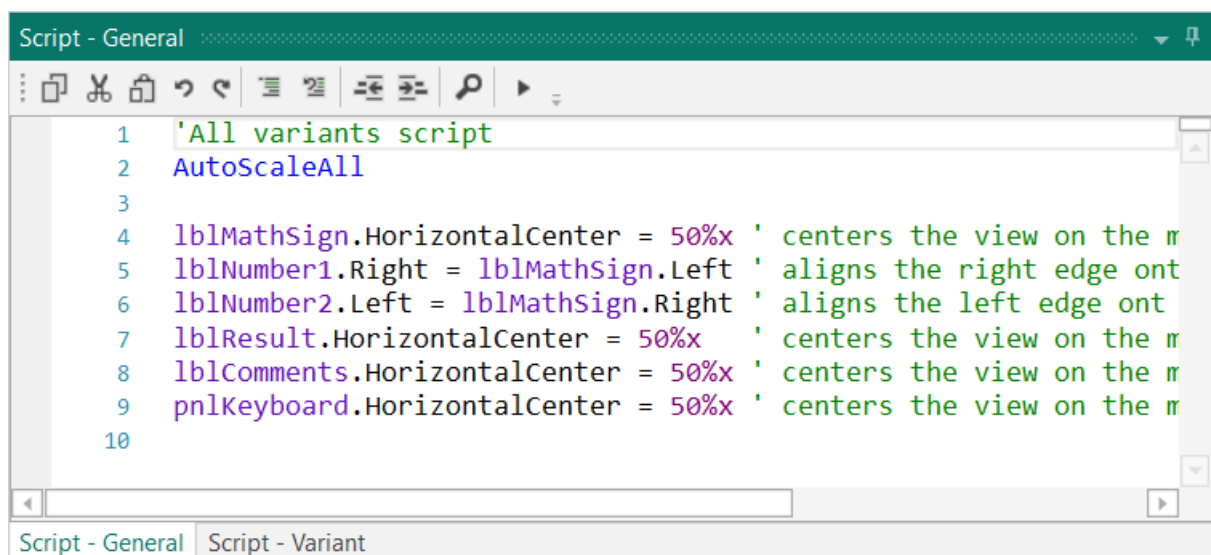

However it is not feasible nor recommended to create many layout variants.

The Designer Scripts will help you fine tune your layout and easily adjust it to different screens and resolutions.

**The idea is to combine the usefulness of the visual designer with the flexibility and power of programming code.**

You can write a simple script to adjust the layout based on the dimensions of the current device and immediately see the results. No need to compile and install the full program each time.

You can also immediately see the results in the Abstract Designer. This allows you to test your layout on many different screen sizes.

Picture from the SecondProgram project.

### 3.14.1 General

Every layout file can include script code. The script is written inside the Visual Designer in the Script window:

There are two types of scripts:

- Script – General, the general script that will be applied to all variants.
- Script – Variant, specific code can be written for each variant.

Once you press on the Run Script button (or F5), the script is executed, and the connected device / emulator and abstract designer will show the updated layout.

The same thing happens when you run your compiled program. The (now compiled) script is executed after the layout is loaded.

The general script is first executed followed by the variant specific script.

The script language is very simple and is optimized for managing the layout.

3.14.2 The menu

	Ctrl + C	Copy
	Ctrl + X	Cut
	Ctrl + V	Paste
	Ctrl + Z	Undo
	Ctrl + Shift + Z	Redo
	Ctrl + Q	Block Comment
	Ctrl + W	Block Uncomment
		Outdent
		Indent
	F3	Find / Replace
	F5	Run

### 3.14.3 Supported Properties

The following properties are supported:

- **Left** / **Right** / **Top** / **Bottom** / **HorizontalCenter** / **VerticalCenter** –

Gets or sets the view's position. The view's width or height will not be changed.

- **Width** / **Height** - Gets or Sets the view's width or height.

- **TextSize** - Gets or sets the text size.

**You should not use 'dip' units with this value as it is already measured in physical units.**

- **Text** - Gets or sets the view's text. TextSize and Text properties are only available to views that show text.

- **Image** - Sets the image file (write-only). Only supported by ImageView.

- **Visible** - Gets or sets the view's visible property.

### 3.14.4 Supported Methods

- **SetLeftAndRight** (Left, Right) - Sets the view's left and right properties. This method changes the width of the view based on the two values.

- **SetTopAndBottom** (Top, Bottom) - Sets the view's top and bottom properties. This method changes the height of the view based on the two values.

### 3.14.5 Supported Keywords

- **And** / **Or** - Same as the standard And / Or keywords.

- **False** / **True** - Same as the standard False / True keywords.

- **Min** / **Max** - Same as the standard Min / Max keywords.

- **Landscape** / **Portrait** - Detects if the layout is in landscape or portrait.  
Can be used with If / Then.

- **AutoScale** - Autoscales a view based on the device physical size. Example: AutoScale(Button1)

- **AutoScaleAll** - Autoscales all layout views.

- **AutoScaleRate** - Sets the scaling rate, a value between 0 and 1. The default value is 0.3  
Example: AutoScaleRate(0.5)

- **ActivitySize** - Returns the approximate activity size measured in inches.

- **If . Else If . Else . Then** condition blocks - Both single line and multiline statements are supported. The syntax is the same as the regular If blocks.

### 3.14.6 Autocomplete

When you begin typing, the AutoComplete function shows all possible keywords or view names containing the written text with the help of the selected keyword.

Example: Au, shows all AutoScale methods.

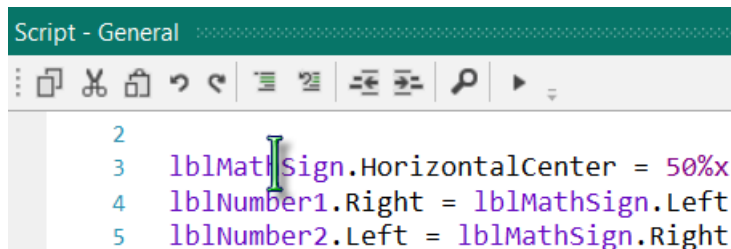

Example: Writing bt, shows all views containing the characters 'b' and 't'.

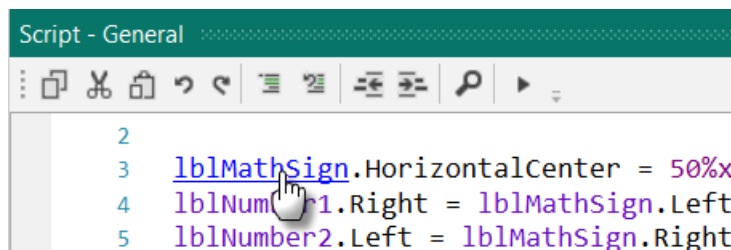

### 3.14.7 Select a view in the DesignerScript with Ctrl + Click

You can select a view directly in the DesignerScript with Ctrl + Click.  
Examples with the SecondProgram.

```
Script - General
2
3 lblMathSign.HorizontalCenter = 50%x
4 lblNumber1.Right = lblMathSign.Left
5 lblNumber2.Left = lblMathSign.Right
```

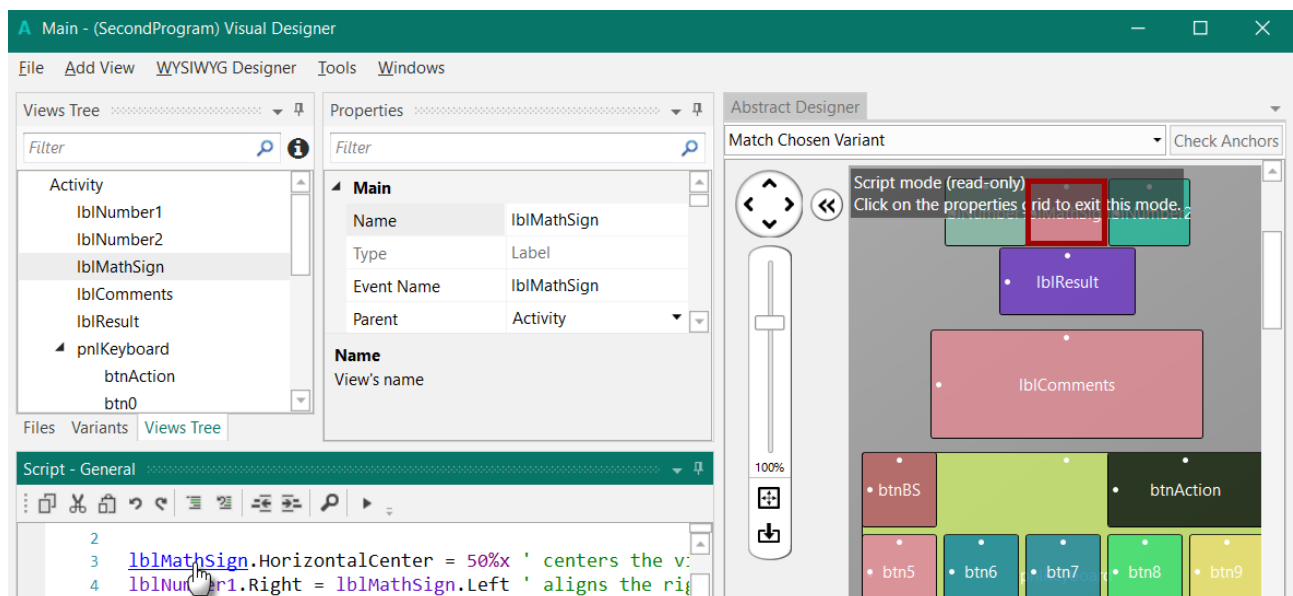

When the cursor is on a view name.

```
Script - General
2
3 lblMathSign.HorizontalCenter = 50%x
4 lblNumber1.Right = lblMathSign.Left
5 lblNumber2.Left = lblMathSign.Right
```

And you press Ctrl,  
The view name is highlighted in blue  
and the cursor becomes a hand.

If you click now, the view is selected.

You see the view name in the Properties window and the view's border is colored in red in the Abstract Designer

### 3.14.8 Notes and tips

- %x and %y values are relative to the view that loads the layout.

Usually it will be the activity or main page. However, if you use `Panel.LoadLayout` then it will be relative to this panel.

- **(B4A only) Use 'dip' units for all specified sizes (except of TextSize).** By using 'dip' units the values will be scaled correctly on devices with higher or lower resolution.

- In most cases it is not recommended to create variants with scales other than 1.0. When you add such a variant you will be given an option to add a normalized variant instead with a scale of 1.0.

- Variables - You can use variables in the script. You do not need to declare the variables before using them (there is no Private, Public nor Dim keyword in the script).

- (B4A only) `Activity.RerunDesignerScript (LayoutFile As String, Width As Int, Height As Int)` - In some cases it is desirable to run the script code again during the program. For example, you may want to update the layout when the soft keyboard becomes visible. `Activity.RerunDesignerScript` method allows you to run the script again and specify the width and height that will represent 100%x and 100%y. For this method to work all the views referenced in the script must be declared in Sub Globals.

Note that this method should **not** be used to handle screen orientation changes. In that case the activity will be recreated, and the script will run during the `Activity.LoadLayout` call.

## 3.15 AutoScale

AutoScale includes three functions:

- `AutoScaleRate(rate)`
- `AutoScale`
- `AutoScaleAll`

Larger devices offer a lot more available space. The result is that even if the physical size of a view is the same, it just "feels" smaller.

Some developers use %x and %y to specify the views size. However, the result is far from being perfect. The layout will just be stretched.

The solution is to combine the "dock and fill" strategy with a smart algorithm that increases the views size and text size based on the running device physical size.

The AutoScale function is based on the standard variant (320 x 480, scale = 1.0).

Since B4A version 3.2 AutoScale considers the dimensions of the variant defined in the layout.

For other screen sizes and resolutions AutoScale calculates a scaling factor based on the equations below.

```
delta = ((100%x + 100%y) / (320dip + 430dip) - 1)
rate = 0.3 'value between 0 to 1.
scale = 1 + rate * delta
```

AutoScale multiplies the Left / Top / Width and Height properties by the scale value.

If the view has a Text property this one is also multiplied by the scale value.

You can play with the 'rate' value. The rate determines the change amount in relation to the device physical size.

Value of 0 means no change at all. Value of 1 is almost like using %x and %y: If the physical size is twice the size of the standard phone, then the size will be twice the original size.

Values between 0.2 and 0.5 seem to give good results. The default value is 0.3.

Be careful when you 'downsize' a layout defined for a big screen to a small screen. The views may become very small.

Note: The size of the CheckBox and RadioButton images is the same for all screen sizes.

The abstract designer is useful to quickly test the effect of this value.

Functions:

- **AutoScaleRate(rate)** Sets the rate value for above equations.  
Example: `AutoScaleRate(0.5)` Sets the rate value to 0.5.

- **AutoScale(View)** Scales the given view.

Example: `AutoScale(btnTest1)`

This is equivalent to :

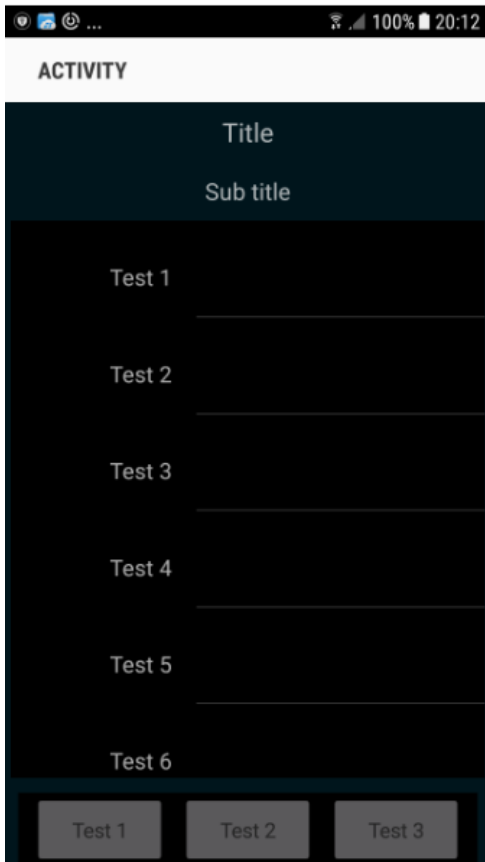

```
btnTest1.Left = btnTest1.Left * scale
btnTest1.Top = btnTest1.Top * scale
btnTest1.Width = btnTest1.Width * scale
btnTest1.Height = btnTest1.Height * scale
btnTest1.TextSize = btnTest1.TextSize * scale
```

- **AutoScaleAll** Scales all the views in the selected layout

### 3.15.1 Simple AutoScale example with only one layout variant

We will AutoScale a simple example with the layout below, source code AutoScaleExample:

The example is written with B4A, but the principle is similar for B4i.

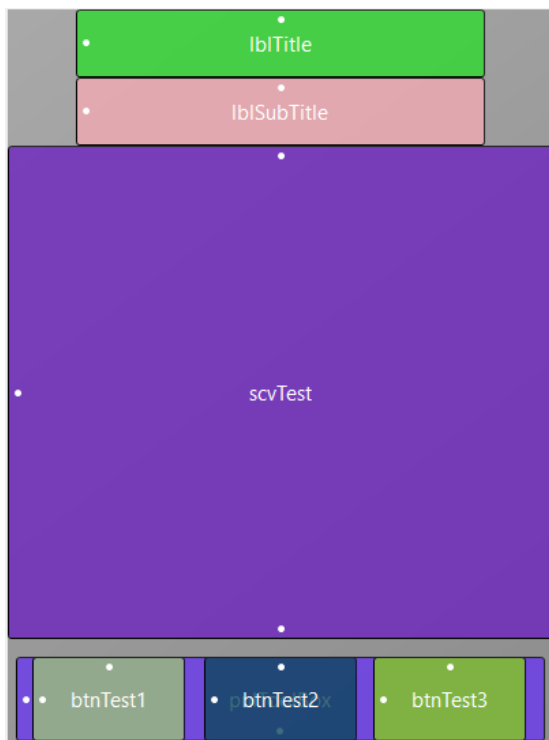

Source code in the *Getting Started\SourceCode* folder.

We have:

- 2 Labels on the top of the screen:
  - lblTitle
  - lblSubTitle
- 1 ScrollView in the middle of the screen:
  - scvTest containing
    - one Panel pnlSetup with
    - 10 Labels lblTest1 to lblTest10
    - 10 EditTexts edtTest1 to edtTest10
- 1 Panel at the bottom of the screen:
  - pnlToolBox
  - Containing 3 Buttons
    - btnTest1
    - btnTest2
    - btnTest3

We have two layout files *Main* for the main screen and *Panel* for the ScrollView content with only one layout variant 320 x 480 scale = 1 (160dip) for each.

Main layout file:

We want to have the:

- Two Labels on the top of the screen and centered horizontally on the screen.
- ToolBox Panel on the bottom of the screen and centered horizontally.
- ScrollView filling the space between the SubTitle Label and the ToolBox Panel.

Note: Look at the anchors especially for the ToolBox and the ScrollView.

First, we set the AutoScaleRate to 0.5 with:  
`AutoScaleRate(0.5)`  
 and AutoScale all views with:  
`AutoScaleAll`

The two Labels are already on top so there is no need to change the Top property for different screen sizes.

But we need to center them on the screen with:

```
lblTitle.HorizontalCenter = 50%x
lblSubTitle.HorizontalCenter = 50%x
```

Then we center the ToolBox with:

```
pnlToolBox.HorizontalCenter = 50%x
```

And we set the Vertical Anchor property of the ToolBox to BOTTOM to 'anchor' it to the bottom of the screen.

This is needed because not all screens have the same width / height ratio and in landscape orientation it would even not be visible.

Then we set the Vertical Anchor property of the ScrollView to BOTH because we want it to fill the space between lblSubTitle and pnlToolBox.

We set the Bottom Edge Distance property to 60 to leave a small space of 10dip between the ScrollView and the ToolBox.

Code in the Designer Scripts of the Main layout in the area for All variants script:

```
'All variants script
```

```
'Set the rate value to 0.5
AutoScaleRate(1)
```

```
'Scale all the views in the layout
AutoScaleAll
```

```
'Center the Labels horizontally to the middle of the screen
lblTitle.HorizontalCenter = 50%x
lblSubTitle.HorizontalCenter = 50%x
```

```
'Center the ToolBox Panel horizontally to the middle of the screen
pnlToolBox.HorizontalCenter = 50%x
```

```
'Center the ScrollView horizontally to the middle of the screen
scvTest.HorizontalCenter = 50%x
```

Panel layout file:

All the Label and EditText views are on a Panel.  
This is needed because they occupy more space than the screen size.

This layout file is loaded into the ScrollView.Panel.

For this layout file we set also the AutoScaleRate value to 0.5 with:

`AutoScaleRate(0.5)`

and AutoScale all views with:

`AutoScaleAll`

There is no need to modify any view after auto scaling.

Code in the Designer Scripts of the Panel layout in the area for 'All variants script':

The whole code is very simply:

'All variants script

`AutoScaleRate(0.5)`

`AutoScaleAll`

In the program the code is the following:

```
Sub Activity_Create(FirstTime As Boolean)
```

```
    ' load the Main layout file
```

```
    Activity.LoadLayout("Main")
```

```
    ' load the ScrollView.Panel layout file
```

```
    scvTest.Panel.LoadLayout("Panel")
```

```
    ' set the ScrollView.Panel.Height to the pnlSetup Panel height
```

```
    scvTest.Panel.Height = pnlSetup.Height
```

```
End Sub
```

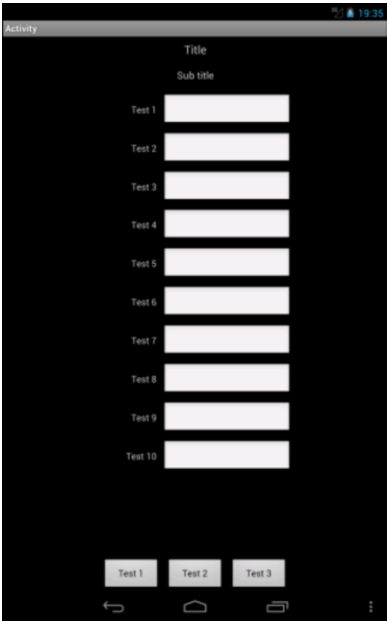

We load the Main layout file into the Activity with `Activity.LoadLayout("Main")`.

We load the Panel layout file into the ScrollView with `scvTest.Panel.LoadLayout("Panel")`.

We set the ScrollView.Panel.Height to the height of the Panel in the layout file with:

`scvTest.Panel.Height = pnlSetup.Height`

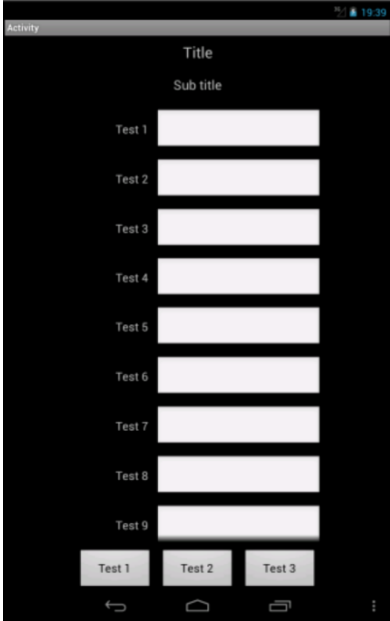

Screenshots of an 800/1280 10" screen Emulator with different Rate values:  
All the images have been downsized.

Rate = 0

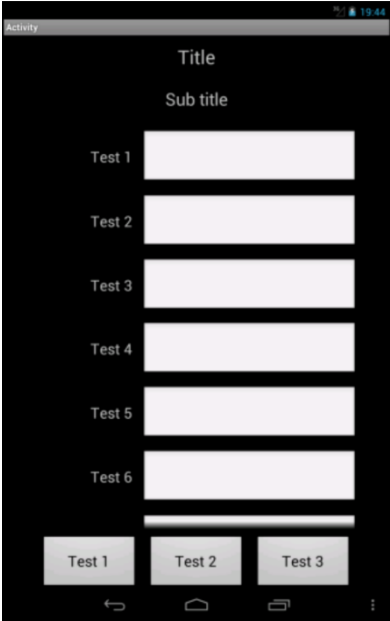

Rate = 0.1

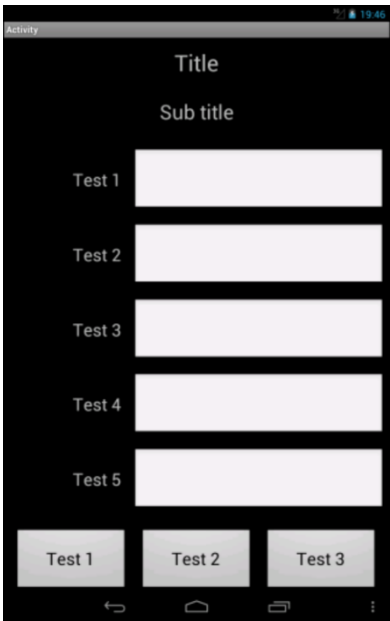

Rate = 0.3

Rate = 0.5

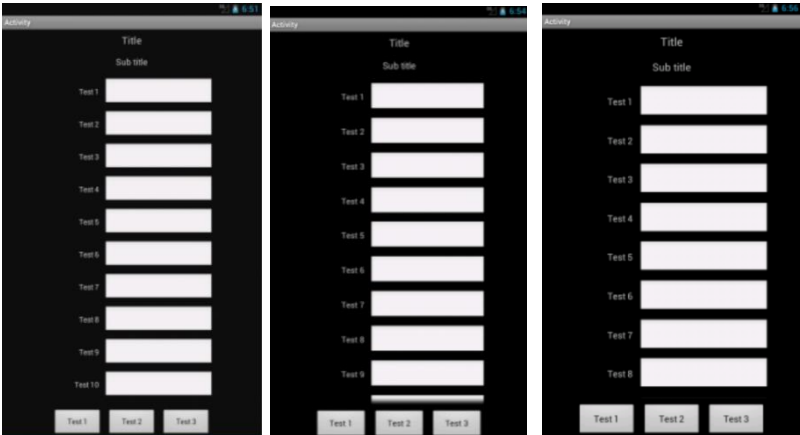

Rate = 0.7

Rate = 1.0

Screenshots of an 480/800 7" screen Emulator with different Rate values:

Rate = 0

Rate = 0.1

Rate = 0.3

Rate = 0.5

Rate = 0.7

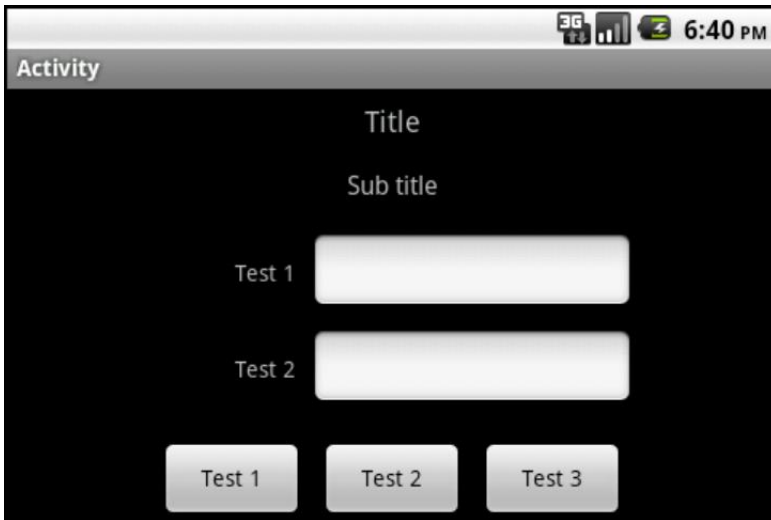

Rate = 1

Screenshots of a 320/480 3.5" screen Emulator. The Rate value has no influence.

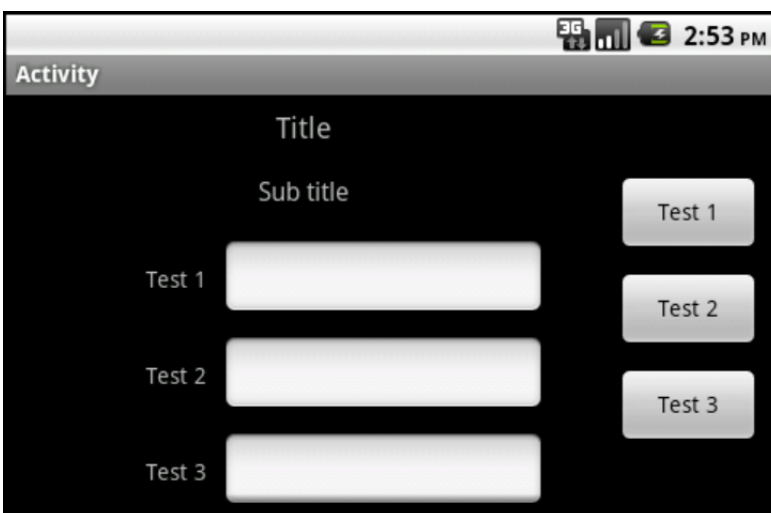

### 3.15.2 Same AutoScale example with portrait and landscape layout variants

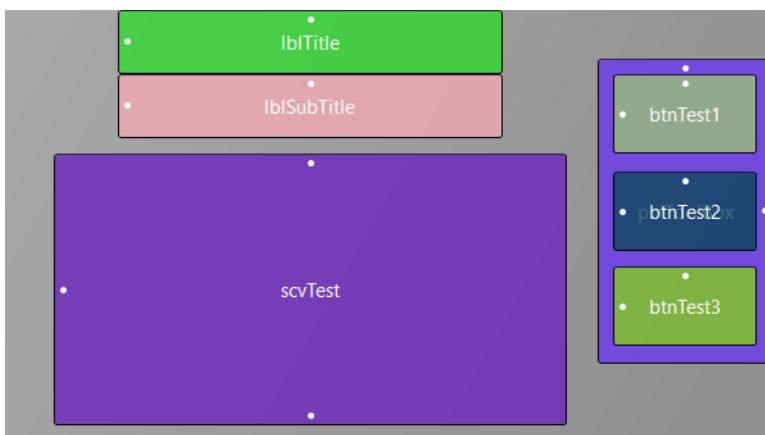

Source code *Getting Started\SourceCode\AutoScaleExample2*:

The previous example doesn't look good on smartphone screens with landscape orientation.

So, we make a new layout variant for landscape where we move the ToolBox with the Buttons to the right side of the screen.

The layout variant in the Main layout file.

Note: Look at the anchors especially for the ToolBox and the ScrollView.

The code in the Designer Script must be changed:

For the portrait variant in the Main layout file, we keep in the `All variants script` area only the code below:

```
'All variants script
AutoScaleRate(0.5)
AutoScaleAll
```

Setting the rate value and autoscaling all the views.

All the other code is moved to the `Variant specific script: 320x480,scale=1` area:

```
'Variant specific script: 320x480,scale=1

'Center the Labels horizontally to the middle of the screen
lblTitle.HorizontalCenter = 50%x
lblSubTitle.HorizontalCenter = 50%x

'Center the ToolBox Panel horizontally to the middle of the screen
pnlToolBox.HorizontalCenter = 50%x

'Center the ScrollView horizontally to the middle of the screen
scvTest.HorizontalCenter = 50%x
```

For the landscape variant we have in the `All variants script` area the same code as for the portrait variant:

```
'All variants script
AutoScaleRate(0.5)
AutoScaleAll
```

And in the `'Variant specific script: 480x320,scale=1` area:

We center the Title and SubTitle Labels to the middle of the space between the left screen border and the left ToolBox boarder with:

```
lblTitle.HorizontalCenter = pnlToolBox.Left / 2
lblSubTitle.HorizontalCenter = pnlToolBox.Left / 2
```

We center the ToolBox vertically to the middle of the screen height with:

```
pnlToolBox.VerticalCenter = 50%y
```

We set the right border of the ToolBox to right border of the screen with:

```
pnlToolBox.Right= 100%x
```

We set the Vertical Anchor property of the ScrollView to BOTH to fill the space between the bottom SubTitle Label border and the bottom screen border with.

And the whole code:

```
'Variant specific script: 480x320,scale=1

'Center the ToolBox Panel vertically
pnlToolBox.VerticalCenter = 50%y

'Center the Labels horizontally to the middle
'of the space between the left screen border
'and the left boarder of the ToolBox Panel
lblTitle.HorizontalCenter = pnlToolBox.Left / 2
lblSubTitle.HorizontalCenter = pnlToolBox.Left / 2

'Center the ScrollView horizontally to the middle
'of the space between the left screen border
'and the left ToolBox Panel border
scvTest.HorizontalCenter = pnlToolBox.Left / 2
```

For the Panel layout file:

The code for the portrait variant remains the same.

We add the same code for the landscape variant:

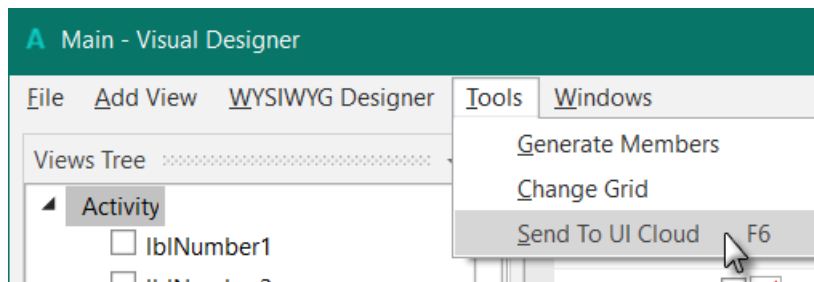

```
'All variants script
AutoScaleRate(0.5)
AutoScaleAll
```

Here too, no code in the 'Variant specific script: 480x320,scale=1 area.

## 3.16 UI Cloud B4A and B4i

With UI Cloud you can check how layouts look on different devices.

When you have defined a layout in the Designer Scripts you can send it to the UI Cloud in the tool's menu.

The layout file is sent to the B4A site, and you get a page showing your layout on different devices with different screen resolutions and densities.

It's a very convenient tool to check the layout look without needing to have physical devices.

UI Cloud checks only layouts defined in the Designer, not layouts defined in the code!

Example of a UI Cloud screen:

### Basic4android UI Cloud

#### Useful links:

- [Supporting Multiple Screens - tips and best practices](#)
- [Designer Scripts Tutorial](#)
- [Designer Scripts & AutoScale Tutorial](#)

#### Build a robust layout in 3 steps:

- **Scale** - Call `AutoScaleAll` keyword to scale the views based on the device physical size
- **Adjust** - Adjust the views position (for example views that need to be docked to the bottom, right or center)
- **Fill** - Use `SetLeftAndRight` and `SetTopAndBottom` methods to resize the views that should fill the available space

This is a temporary link. It will expire in several minutes.

## 3.17 Designer Script Extension / DesignerUtils Class

Designer Script Extension is a Class, called DesignerUtils, which allows calling B4X code from the visual designer scripts.

The B4X code is not executed at design time.

The best way to explain what you can do with Designer Script Extension is by a simple example. It is a B4XPages project, the source code is in the *VisualDesignerSourceCode\DSEFirstSteps* folder.

We will develop a small ToolBox with some buttons at the bottom, which are dimensioned to cover the entire width.

We have two layouts:

- MainPage, this has a Panel / Pane at the bottom of the page.
- ToolBox, it is a Panel / Pane with the five Buttons.

In the code in the B4XMainPage module is:

In Sub Class\_Globals, we declare the DesignerUtils Class.

```
Sub Class_Globals
    Private Root As B4XView
    Private xui As XUI

    Private DU As DesignerUtils 'declares the DesignerUtils Class
End Sub
```

In the B4XPage\_Created routine, we:

- register the calling module
- initialize the DesignerUtils Class
- register the DesignerUtils Class
- load the 'MainPage' layout
- load the 'ToolBar' onto each view in the DesignerUtils 'toolbar' class defined in the ToolBar layout.

```
Private Sub B4XPage_Created (Root1 As B4XView)
    Root = Root1

    'the lines below must be before LoadLayout
    xui.RegisterDesignerClass(Me) 'register the calling module
    DU.Initialize 'initialize DesignerUtils
    xui.RegisterDesignerClass(DU) 'register DesignerUtils

    Root.LoadLayout("MainPage")

    'gets the views in the ToolBar Class
    For Each p As B4XView In DU.GetViewsByClass("toolbar")
        'loads the layout in each view, only one in our case
        p.LoadLayout("ToolBar")
    Next
```

[End](#) [Sub](#)

And the ScaleToolBar routine, which is called in the DesignerScript in the ToolBar layout.  
We calculate the space between the Buttons and their width and set their Left and Width properties.

```
'scales the ToolBar layout
'this routine is called in the Designer ToolBar layout
Private Sub ScaleToolBar(DesignerArgs As DesignerArgs)
    Private i, Origin, Space, Width As Int
    Private Parent As B4XView

    Parent = DesignerArgs.Parent
    Private pnl As B4XView
    pnl = DesignerArgs.GetViewByName("pnlToolBar")
    pnl.Width = Parent.Width
    Space = Parent.Width / 80 '1.25 % of the total width
    Width = (Parent.Width - (pnl.NumberOfViews + 1) * Space) / pnl.NumberOfViews
    Origin = (Parent.Width - Width * pnl.NumberOfViews - (pnl.NumberOfViews + 1) * Space)
/ 2 + Space
    For i = 0 To pnl.NumberOfViews - 1
        Private v As B4XView
        v = pnl.GetView(i)
        v.Left = Origin + i * (Width + Space)
        v.Width = Width
    Next
End Sub
```

In the layout files we have:

- In the MainPage layout,  
We have the pnlToolBar Panel / Pane at the bottom.

And we add the “toolbar” class in the Script.

```
DDD.AddClass("toolbar", pnlToolBar)
```

DDD is the DesignerUtils Class.

"toolbar" is the Class name.

pnlToolBar is the object concerned by the class, there can be more than one object.

- In the ToolBar layout.  
Five Buttons on a Panel / Pane.

And the Script code:

DDD.CollectViewsData collects all data of the views in this layout.

B4XMainPage.ScaleToolBar calls the ScaleToolBar routine in the B4XMainPage module

### 3.17.1 Define a routine for the Designer

You can define a routine for the Designer in any module even classes.

Example in a Class.

We define a 'standard class': MyDesignerUtils and save it in the parent folder.

We define a routine which sets the background color, the text, the text size and the text color for a B4XView.

Code in the Class:

The routine looks like this:

```
'Sets the BackgroundColor, Text, TextSize and TextColor
'Parameters: B4XView, BackgroundColor, Text, TextSize, TextColor
Private Sub SetColorTextSizeColor(DesignerArgs As DesignerArgs)
    Private bv As B4XView
    bv = DesignerArgs.GetViewFromArgs(0)
    bv.Color = DesignerArgs.Arguments.Get(1)
    bv.Text = DesignerArgs.Arguments.Get(2)
    bv.TextSize = DesignerArgs.Arguments.Get(3)
    bv.TextColor = DesignerArgs.Arguments.Get(4)
End Sub
```

- In green the comments for the intellisense.
- `Private Sub`  
Do not to declare it as Public.
- `SetColorTextSizeColor`  
The routine name.
- `(DesignerArgs As DesignerArgs)`  
The routine signature, always the same for any routine.
- And your code.

With the predefined signature above the Designer knows that this routine is dedicated for him. The comments before the routine will be displayed in the intellisense in the Designer Scripts. You MUST specify the required parameters to ensure that the user knows what he is supposed to enter as parameters. It is the only way to know it.

In the layout we have a Button: Button1.

And the code in the Designer Script:

```
MyDesignerUtils.SetColorTextSizeColor(Button1, 0xFF0000FF, "Test", 20, 0xFFFFFFFF00)
```

When you type My in the Designer you will see the Class in the intellsense:

```
5 My|  
  MyDesignerUtils
```

Then, select MyDesignerUtils and you will see the available methods:

```
5 MyDesignerUtils.  
  SetColorTextSizeColor
```

Then, select the method and you will see the comments:

```
5 MyDesignerUtils.  
  SetColorTextSizeColor
```

Sets the BackgroundColor, Text, TextSize and TextColor  
Parameters: B4XView, BackgroundColor, Text, TextSize, TextColor

### 3.17.2 Make a b4xlib library

You can also easily save the class as a b4xlib library.  
I changed the bas file name to *MyDesignerUtilsLib.bas*.

Define a simple text file: manifest.txt with this content:

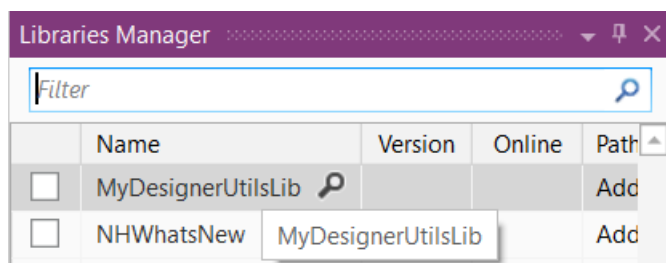

```
Version=1.0  
Author=Klaus CHRISTL
```

Nothing else, there are no dependencies.

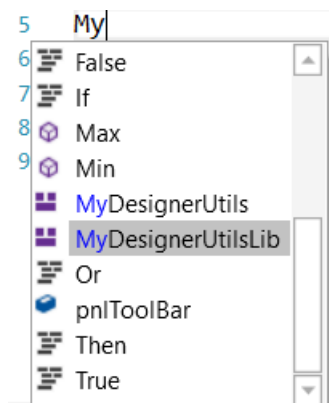

Then, zip both files with 7zip and name it *MyDesignerUtilsLib.b4xlib*.

Save it in the AdditionalLibraries\B4X folder.

Refresh the Libraries Manager Tab and you will see the new library:

Check it and type in the Designer Scripts My:

And you see it.

### 3.17.3 DesignerUtils methods B4X code

The methods below are available in B4X code.

You need to declare the DesignerUtils library in **Class\_Globals**.

```
Private DU As DDD 'declares the DesignerUtils Class
```

#### 3.17.3.1 AddRuntimeView

**AddRuntimeView** (View As B4XView, Name As String, LayoutParent As B4XView, Classes As List)

Adds the data for a view added at runtime.

#### 3.17.3.2 GetAllLayoutParents

Returns a list with all layout parents (views).

#### 3.17.3.3 GetViewByName

**GetViewByName** (LayoutParent As B4XView, Name As String)

Gets a view by its name. Make sure to call DDD.CollectViewsNames in the designer script.

Example:

```
Private pnl As B4XView  
pnl = DesignerArgs.GetViewByName("pnlToolBar")
```

#### 3.17.3.4 GetViewData

**GetViewData** (View As B4XView)

Returns the view's data or Null if not exists. Make sure to call CollectViewsData in the designer script.

#### 3.17.3.5 GetViewsByClass

**GetViewsByClass** (Class As String)

Get all views with the given class attribute. The attribute is added in the designer script with DDD.AddClass.

Example:

```
For Each p As B4XView In DU.GetViewsByClass("toolbar")  
    'loads the layout in each view, only one in our case  
    p.LoadLayout("ToolBar")  
Next
```

### 3.17.3.6 Initialize

Initializes the DesignerUtils class. Called once in any B4XMainPage module where it is used ???

```
DU.Initialize    'initialize DesignerUtils
```

### 3.17.3.7 RemoveLayoutData

**RemoveLayoutData** (LayoutParent [As B4XView](#))

Removes the data that was stored for this layout.  
This is relevant if you previously called AddClass or CollectViewsData.

### 3.17.4 DesignerUtils methods Script code

The methods below are available in Designer Script code only.

#### 3.17.4.1 AddClass

**AddClass** (Name As String, View1 As B4XView, View2 As B4XView ...)

Adds a class attribute to one or more views.  
Parameters: ClassName, One or more views.

Example:

```
DDD.AddClass("numpad", Pane1, Pane2, Pane3)
```

#### 3.17.4.2 CollectViewsData

Collects data about the loaded views. The views can be retrieved at runtime with GetViewByName method.

Example:

```
DDD.CollectViewsData
```

#### 3.17.4.3 Color

Converts a string hex or name color to an int color.

Example:

```
MyDesignerUtils.SetColorTextSizeColor(Button1, DDD.Color(0xFF0000FF), "Test", 20,  
DDD.Color(0xFFFFFFFF00))
```

#### 3.17.4.4 CreateToolbar

**CreateToolbar** (DesignerArgs As DesignerArgs)

The panel should include a single label. The label text properties will be used and the label will be removed.

Parameters: Panel, EventName, [label, tag]+

Example:

```
DDD.CreateToolbar(Pane1, "BottomToolbar", DDD.ToChr(0xF015), "home", _  
    DDD.ToChr(0xF217) & " abc", "cart", DDD.ToChr(0xF1D9), "send")
```

#### 3.17.4.5 SetText

**SetText**(DesignerArgs As DesignerArgs)

Sets the first text that fits.

Parameters: View, One or more strings.

Example:

```
DDD.SetText(Button1, "Sunday", "Sun", "1")
```

### 3.17.4.6 SetTextAndSize

**SetTextAndSize**(DesignerArgs As DesignerArgs)

Extends SetText with adjustment of the text size. Note that the second parameter is the base text size.

Parameters: View, Base text size, One or more strings.

Example:

```

TextSize = 16
DDD.SetTextAndSize(Button1, TextSize, "Sunday", "Sun", "1")
DDD.SetTextAndSize(Button2, TextSize, "Monday", "Mon", "2")
DDD.SetTextAndSize(Button3, TextSize, "Tuesday", "Tue", "3")
DDD.SetTextAndSize(Button4, TextSize, "Wednesday", "Wed", "4")
DDD.SetTextAndSize(Button5, TextSize, "Thursday", "Thu", "5")
DDD.SetTextAndSize(Button6, TextSize, "Friday", "Fri", "6")
DDD.SetTextAndSize(Button7, TextSize, "Saturday", "Sat", "7")

```

### 3.17.4.7 SetTextSizeSteps

**SetTextSizeSteps**(DesignerArgs As DesignerArgs)

Sets the text size steps that will be used when setting the text with SetTextAndSize. Default value is 1, 0.8.

### 3.17.4.8 SpreadControlsHorizontally

**SpreadControlsHorizontally** (DesignerArgs As DesignerArgs)

Spreads the controls evenly.

Parameters: Panel, Maximum size of each control (0 for no maximum), Minimum gap between controls.

Example:

```

DDD.SpreadControlsHorizontally(Pane1, 120dip, 10dip)

```

### 3.17.4.9 ToChr

**ToChr**(DesignerArgs As DesignerArgs) As String

Same as B4X Chr keyword. Expects a single codepoint parameter.

Example:

```

DDD.CreateToolbar(Pane1, "BottomToolbar", DDD.ToChr(0xF015), "home", _
    DDD.ToChr(0xF217) & " abc", "cart", DDD.ToChr(0xF1D9), "send")

```

## 4 Open a layout file directly from the IDE

The ‘normal’ way to open the Designer is to click on Open Designer in the Designer menu.

Two other methods exist to open a specific layout file directly from the IDE.

### 4.1 Directly in the code

When you hover over a layout name, in the code with the Ctrl key pressed, the layout name is highlighted like a link.

```
Sub Activity_Create(FirstTime As Boolean)
    Activity.LoadLayout("Main")
    Activity.Title = "SQLiteLight3"
End Sub
```

When you click on it, the Designer will be opened with the selected layout.

### 4.2 From the Files Manager Tab

In the Files Manager Tab you see at the end of each layout filename (open designer). When you hover over it, the mouse cursor changes to the hand and when you click on it the Designer is opened with the selected layout file.
